DISCLAIMER

Specifications are subject to change without notice. Startco Engineering Ltd. is not liable for contingent or consequential damages, or for expenses sustained as a result of incorrect application, incorrect adjustment, or a malfunction.
1. GENERAL

1.1 MODERN RESISTANCE-GROUNDED SYSTEMS

In the past, a resistance-grounded system often used a neutral-grounding resistor (NGR) with a high let-through current. In a system with a high let-through current, point-of-fault damage and flash hazard are significant problems. These problems can be eliminated with a low-let-through-current NGR. Modern ground-fault protection is designed to operate at these levels.

NGR selection depends on whether the system is an alarm-only or a tripping system. Alarm-only systems are usually restricted to system voltages up to 5 kV with NGR let-through currents of 5 A or less. Occasionally, alarm-only systems up to 15 kV and up to 10 A are used; however, they are not common because a ground fault on such a system tends to escalate to a phase-to-phase fault before the ground fault can be located and cleared.

In an alarm-only system or in a tripping system without selective coordination, choose an NGR with a let-through current larger than the system charging current. System charging current is the capacitive current that flows to ground when a bolted ground fault occurs. The magnitude of charging current is typically ½ A per 1,000 kVA on low-voltage systems and 1 A per 1,000 kVA on medium-voltage systems. Consequently, there is flexibility in choosing low-current NGR’s for these systems. The pick-up current of ground-fault devices is usually set at or below 50% of the NGR let-through current in an alarm-only system and at or below 20% in a tripping system.

In a tripping system with selective coordination, use ground-fault devices with a definite-time characteristic to achieve time coordination. Use the same pick-up current for all ground-fault devices—this value must be larger than the charging current of the largest feeder. Select an NGR with a let-through current between five and ten times the pick-up current of the ground-fault devices.

Do not use a grounding transformer with a low-voltage resistor:

- The combined cost of a transformer and a low-voltage resistor is more than the cost of a resistor rated for line-to-neutral voltage.
- A transformer saturated by a ground fault through a rectifier can make ground-fault protection inoperative.
- Transformer inrush current up to twelve times rated current can cause a ground-fault voltage larger than expected.
- A parallel transformer winding makes it difficult to monitor NGR continuity.
- A transformer can provide the inductance necessary to cause ferroresonance if the NGR opens.

Following these guidelines will minimize the flash hazard, minimize point-of-fault damage, achieve reliable ground-fault protection, and ensure a stable system not subject to ferroresonance.

1.2 SE-325 NGR MONITORING

The SE-325 is a neutral-grounding-resistor monitor for resistance-grounded systems up to 25 kV. It measures current in a transformer or generator neutral, neutral-to-ground voltage, and continuity of the neutral-grounding resistor. The SE-325 coordinates these three measurements to detect a failed NGR or a ground fault and provides one output contact for shunt or undervoltage operation in a main-breaker trip circuit. Trips are latched and indicated by LED’s.

Ground-fault current is sensed by a CT200 window-type current transformer. Either CT input can be grounded to meet electrical codes. A trip level of 0.5, 2.0, or 4.0 A is switch selectable for use with a 5-, 15-, or 25-A grounding resistor. Trip time is adjustable from 0.1 to 2.0 seconds.

Neutral-to-ground voltage and continuity of the neutral-grounding resistor are continuously measured through an ER-series external sensing resistor connected to the neutral. A resistor fault will be detected if ground-fault current is not detected and neutral-to-ground voltage exceeds the trip-level setting, or if NGR resistance exceeds the trip resistance. A resistor-fault hold-off circuit prevents nuisance trips in alarm-only systems.

For additional information on neutral-grounding-resistor monitoring, see “Monitoring Neutral-Grounding Resistors” at www.startco.ca.

2. OPERATION

2.1 SETTINGS

2.1.1 GF TRIP TIME

Ground-fault trip time is adjustable from 0.1 to 2.0 seconds. Time-coordinated ground-fault protection requires this setting to be longer than the trip times of downstream ground-fault devices.

For the extended trip-time option, trip time is adjustable from 0.1 to 5.0 seconds.

2.1.2 GF

The ground-fault-circuit trip level is 0.5, 2.0, or 4.0 A when current is sensed with a CT200 current transformer. Since the ground-fault-circuit trip level should not be greater than 20% of the grounding resistor let-through current, these levels are appropriate for use with 5-, 15-, or 25-A grounding resistors. See Table 1. For other applications, the trip level of the ground-fault circuit is 0.25, 1.0, or 2.0% of the primary rating of the 5-A-secondary current transformer.
2.1.3 MODE
In the shunt-trip mode (SH), the output relay energizes and its contact closes if a resistor-fault or ground-fault trip occurs. The shunt-trip mode is not fail-safe because shunt-trip devices do not operate if supply voltage fails.

In the undervoltage mode (UV), the output relay energizes and its contact closes if the resistor-fault and ground-fault circuits are not tripped. The undervoltage mode is referred to as fail-safe because undervoltage devices release if supply voltage fails.

2.1.4 RES
This switch setting must correspond to the resistance of the external sensing resistor. For the ER-600VC and ER-5KV, select 20K. For the ER-15KV and ER-25KV, select 100K.

2.1.5 RES TRIP LEVEL
Neutral-to-ground trip voltage is adjustable from 20 to 400 Vac with a 20-kΩ sensing resistor, and 100 to 2,000 Vac with a 100-kΩ sensing resistor. To prevent false resistor-fault trips, the RES TRIP LEVEL should be set higher than the voltage across the neutral-grounding resistor when neutral-to-ground current is equal to the operating value of the ground-fault circuit. See Table 1.

2.2 INDICATION AND RESET
The green POWER LED indicates that the internal power supply is on. Red LED's indicate ground-fault and resistor-fault trips. When a trip occurs, the SE-325 remains latched until the reset switch is pressed or supply voltage is cycled. Terminals are provided for remote indication and reset as shown in Fig. 1.

For the non-latching option, the SE-325 resets when the fault clears.

2.3 FUSING
The output contact is protected by fuse F1 (4.0 A, time delay).

3. INSTALLATION

3.1 SE-325

SE-325 outline and mounting details are shown in Fig. 2. Typical connections are shown in Fig. 1. Connect supply voltage to L1 and L2. For a 120-Vac supply, connect supply neutral to L2. For a direct-current supply, connect supply negative to L2. Connect chassis-bonding terminal to ground.

Face-plate LED's are driven in series with remote-indication LED's. When remote-indication LED’s are not used, terminals GI, +, and RI must be connected for the face-plate LED’s to operate. These jumpers are installed at the factory.

Install the upper terminal-block cover to prevent inadvertent contact with line terminals.

Connect contact terminals A and B as required.

2. TERMINAL-BLOCK SCREWS: 6-32 x 0.25.
3. MOUNTING SCREWS: M4 OR 8-32.
4. SHOWN WITH TERMINAL-BLOCK COVER REMOVED.
5. MINIMUM CLEARANCE FOR FUSE REMOVAL.

FIGURE 2. SE-325 Outline and Mounting Details.
3.2 GROUND-FAULT CT

Outline and mounting details for CT200 and CT200L current transformers are shown in Fig. 3. Ground-fault-CT connections and the preferred ground-fault-CT location are shown in Fig. 1. If a ground fault in the NGR is unlikely, a minimal loss of protection will result if the ground-fault CT monitors the NGR connection to ground rather than its connection to the neutral. This alternate CT location is shown in Fig. 1.

Connect the secondary of the ground-fault CT to SE-325 terminals CT1 and CT2. The CT connection to the SE-325 is not polarity sensitive. Ground one side of the CT secondary. For electrically noisy environments or lead lengths in excess of 10 m (30 ft), use shielded, twisted-pair cable.

3.3 Sensing Resistor

Outline and mounting details for ER-600VC, ER-5KV, ER-15KV, and ER-25KV sensing resistors are shown in Figs. 4, 5, 6, and 7. Locate the NGR and the sensing resistor near the transformer or generator. Ground sensing-resistor terminal G. Pass the sensing-resistor-to-neutral conductor and the NGR-to-neutral conductor through the ground-fault-CT window as shown in Fig. 1. Separately connect sensing-resistor terminal N and the NGR to the neutral to include neutral connections in the monitored loop. If a ground fault in the sensing-resistor conductor is unlikely, a minimal loss of protection will result if it does not pass through the ground-fault-CT window.

**CAUTION:** Voltage at terminal N rises to line-to-neutral voltage when a ground fault occurs. The same clearances are required for sensing resistors as for NGR's.

**NOTE:** The neutral-to-sensing-resistor connection is not a neutral conductor as defined in Canadian Electrical Code Section 10-1108 and National Electrical Code Section 250.36(B). It is not required to be 8 AWG or larger. Since current through this conductor is always less than 150 mA, a 14 AWG conductor insulated to the system voltage is more than sufficient.

FIGURE 10. RK-325I Remote Indication Assembly.

FIGURE 11. RK-13 Relay Interface Module.
3.4 ISOLATED-GROUND CONNECTION

The SE-325 is intended for use in installations where the NGR is connected to local ground. Some installations require the NGR to be isolated from local ground. See Technical Information 3.1 “NGR Monitoring with Isolated Ground Beds” at www.startco.ca.

3.5 OVERHEAD LINES

In overhead-line applications, atmospheric conditions can cause false resistor-fault trips. The “S” option or an SE-330 is recommended for these applications.

3.6 REMOTE OPERATION

Terminals SW, GI, +, and RI are provided for remote LED indication and remote reset as shown in Fig. 1. Remote LED's are driven in series with the front-panel LED’s.

Remove factory-installed jumpers from terminals GI, +, and RI, and connect a remote kit as shown in Fig. 1. Optional remote kits are shown in Figs. 8, 9, and 10. Standard LED indicator lamps are not compatible with the SE-325.

For general-purpose applications, use the RK-325 Remote Indication-and-Reset Assembly or the RK-325I Remote Indication Assembly. Connect terminals SW, GI, +, and RI to remote-kit terminals SW, GI, +, and CI/RI.

For 22-mm-component RK-302 applications, connect terminal X2 of the red ground-fault indicator to GI, terminal X2 of the red resistor-fault indicator to RI, and connect indicator X1 terminals to +. For remote reset, connect the normally open push-button switch across terminals + and SW.

If indication is required from a separate voltage source, or if separate ground-fault and resistor-fault contacts are required, use an RK-13 Relay Interface Module. The RK-13 mounts on the SE-325 lower terminal block and it is compatible with the RK-302, RK-325 and RK-325I. See Figs. 1 and 11. Contact K1 closes when the GF LED is on and contact K2 closes when the RF LED is on.

3.7 GROUND-FAULT TESTING

Use CT-primary current injection to test the ground-fault circuit. Fig. 12 shows test circuits using the Startco SE-400 Ground-Fault-Relay Test Unit and the SE-100T Ground-Fault-Relay Tester. The SE-400 has a programmable output of 0.5 to 9.9 A for a duration of 0.1 to 9.9 seconds. The SE-100T has LO and HI outputs for 5- and 15-A resistance-grounded systems.

A test-record form is provided in Section 7 of this manual. Record the test results and test dates on this form to meet the requirements of the National Electrical Code (NEC). Retain the form so that the test data can be made available to the authority having jurisdiction.

4. TECHNICAL SPECIFICATIONS

4.1 SE-325

Supply:
- ac ........................................... 120 or 240 Vac (+10, -50%), 50/60 Hz, 10 VA
- ac/dc ...................................... 120 Vdc (+40, -8%), 5 W or 120 Vac (+10, -29%), 47 to 440 Hz, 5 VA

NOTE: Voltage between supply terminals (L1, L2) and ground terminal (G) must not exceed 300 Vac continuous or 1,250 Vac under transient conditions.

Dimensions:
- Height.................................... 150 mm (5.9”)
- Width.................................... 109 mm (4.3”)
- Depth..................................... 100 mm (4.0”)

Shipping Weight....................... 1 kg (2.2 lb)

Environment:
- Operating Temperature ........ -40 to 60°C
- Storage Temperature ............ -55 to 80°C
- Humidity............................... 85% Non-Condensing

Ground-Fault Circuit:
- CT Ratio.............................. 200:5
- CT Input Burden................... 0.02 Ω
- Trip Level (1) ......................... 0.5, 2.0, or 4.0 A
- Frequency Response........... 25 to 400 Hz, 25 to 110 Hz with Option H
- Trip Time.............................. 0.1 to 2.0 s, 0.1 to 5.0 s with Option T
- Thermal Withstand (1) ......... 200 A Continuous, 2,500 A for 2 s
- Trip-Level Accuracy .......... +10, -20%
- CT Lead Resistance Limit (2) 0.5 A Trip Level........... 2 Ω
- 2 A Trip Level............... 5 Ω
- 4 A Trip Level............... 5 Ω
- Trip-Time Accuracy............. 10%
- Operating Mode................. Latching, Non-latching with Option N

(1) Currents referred to primary of CT200 for prospective ground-fault currents less than 4,000 A.
(2) Typical maximum CT lead resistance to meet specified trip level accuracy.
Resistor-Fault Circuit:
Neutral-To-Ground

Trip Voltage \( V_N \) ................. 20 Vac to 2,000 Vac
Adjustable

Trip Resistance, \( V_N = 0 \)
ER-600VC or ER-5KV ..... 2 kΩ
ER-15KV or ER-25KV .... 6 kΩ,
50 kΩ with Option S

Trip-Resistance Accuracy ....+5, -2% of Sensing
Resistor Resistance

Trip Time .................................. 5 ± 0.5 s,
20 ± 3 s with Option S

Operating Mode .............. Latching,
Non-latching with Option N

Output Relay:
CSA/UL Contact Rating ...... 1 mA to 4 A Resistive,
240 Vac or 28 Vdc

Supplemental Contact Ratings:
Make/carry 0.2 s .............. 10 A
Carry continuous .......... 4 A
Break:
dc ........................................ 20 W resistive,
10 W inductive
(L/R = 0.04 s)
ac ........................................ 960 VA resistive,
700 VA inductive
(PF = 0.4)

Subject to maximums of 4 A and 240 V (ac or dc)

Contact Configuration ........ N.O. (Form A)
Fuse Rating (F1) ............. 4.0 A, 250 Vac,
Time Delay
Fuse Part Number ............ Bussman MSL-4 or
Littelfuse 313.004

Operating Mode ............ UV (Fail-Safe) or
SH (Non-Fail-Safe)

Remote Indication:
+ .................. 12 Vdc
GI/RI .................. Current Sink,
560 Ω Internal

Optional RK-13 Module:
Contact Ratings ........... 100 mA, 120 Vac
Contact Configuration ...... N.O. (Form A)
Reset Input ................. 24 to 120 V (ac or dc),
Isolated

PWB Conformal Coating ....... MIL-1-46058 qualified,
UL QMJU2 recognized

4.2 SENSING RESISTORS

ER-600VC:
Maximum Voltage ........ 600 Vac
Maximum Current ........ 30 mA
Resistance ................ 20 kΩ
Thermal:
420 Vac .................. Continuous
600 Vac ................. 6 minutes on,
............................. 60 minutes off
Shipping Weight ........... 300 g (0.7 lb)

ER-5KV:
Maximum Voltage ........ 2,500 Vac
Maximum Current ....... 125 mA
Resistance .............. 20 kΩ
Thermal ....................... Continuous
Shipping Weight ............ 5.0 kg (11 lbs)

ER-15KV:
Maximum Voltage ........ 8,400 Vac
Maximum Current ....... 84 mA
Resistance ................ 100 kΩ
Thermal ....................... 1 minute on,
............................. 120 minutes off
Shipping Weight ........... 5.0 kg (11 lbs)

ER-25KV:
Maximum Voltage ........ 14,400 Vac
Maximum Current ....... 144 mA
Resistance .............. 100 kΩ
Thermal ....................... 1 minute on,
............................. 120 minutes off
Shipping Weight ........... 20 kg (44 lbs)

4.3 CURRENT TRANSFORMER

CT200:
Current Ratio ............... 200:5 A
Insulation .................. 600-V Class
Window Diameter ....... 56 mm (2.2”)
Shipping Weight .......... 1 kg (2.2 lbs)

Certification .............. CSA, Canada and USA

Australia

Commonwealth of Pennsylvania
SE-325 ...... BOTE 1767-99
SE-325P .... BOTE 1797-00

Remote Indication and Reset:
RK-302.............................Includes two LED pilot
                                 lights, a reset push button,
                                 and legend plates
RK-325.............................Indication-and-Reset
                                 Assembly
RK-325I............................Indication Assembly
RK-13...............................Relay Interface Module

6. WARRANTY

The SE-325 Neutral-Grounding-Resistor Monitor is warranted to be free from defects in material and workmanship for a period of five years from the date of purchase.

Startco Engineering Ltd. will (at Startco’s option) repair, replace, or refund the original purchase price of an SE-325 that is determined by Startco to be defective if it is returned to the Startco factory, freight prepaid, within the warranty period. This warranty does not apply to repairs required as a result of misuse, negligence, an accident, improper installation, tampering, or insufficient care. Startco Engineering Ltd. does not warrant products repaired or modified by non-Startco Engineering Ltd. personnel.

Startco Engineering Ltd. is not liable for contingent or consequential damages; for expenses sustained as a result of incorrect application, incorrect adjustment, or a malfunction; or for expenses resulting from the use of, or inability to use, the product.
7. TEST PROCEDURES

7.1 GROUND-FAULT PERFORMANCE TEST

To meet the requirements of the National Electrical Code (NEC), as applicable, the overall ground-fault protection system requires a performance test when first installed. A written record of the performance test is to be retained by those in charge of the electrical installation in order to make it available to the authority having jurisdiction. A test-record form is provided for recording the date and the final results of the performance tests. The following ground-fault system tests are to be conducted by qualified personnel:

a) Evaluate the interconnected system in accordance with the overall equipment manufacturer’s detailed instructions.

b) Verify proper location of the ground-fault current transformer. Ensure the cables pass through the ground-fault-current-transformer window. This check can be done visually with knowledge of the circuit. The connection of the current-transformer secondary to the SE-325 is not polarity sensitive.

c) Verify that the system is correctly grounded and that alternate ground paths do not exist that bypass the current transformer. High-voltage testers and resistance bridges can be used to determine the existence of alternate ground paths.

d) Verify proper reaction of the circuit-interrupting device in response to a simulated or controlled ground-fault current. To simulate ground-fault current, use CT-primary current injection. Fig. 12a shows a test circuit using a Startco SE-400 Ground-Fault-Relay Test Unit. The SE-400 has a programmable output of 0.5 to 9.9 A for a duration of 0.1 to 9.9 seconds. Set the test current to 0.6, 2.3, or 4.6 A for SE-325 units set at 0.5, 2.0, or 4.0 A respectively. Fig. 12b shows a test circuit using a Startco SE-100T Ground-Fault-Relay Tester. The SE-100T provides a test current of 0.65 or 2.75 A for testing 0.5- and 2.0-A trip levels. Inject the test current through the current-transformer window for at least 2.5 seconds. Verify that the circuit under test has reacted properly. Correct any problems and re-test until the proper reaction is verified.

e) Record the date and the results of the test on the attached test-record form.

Retain this record for the authority having jurisdiction.
7.2 RESISTOR-FAULT TESTS
Perform tests with system de-energized and supply voltage applied to the SE-325.

7.2.1 OPEN TEST
Test Equipment: 20-kΩ and 100-kΩ, ¹⁄₄-watt, 1% resistors.

Procedure:
• Remove connections to SE-325 R and G terminals.
• Connect the 20-kΩ resistor to R and G terminals.
• Set the RES switch to 20K.
• Press RESET.
• The RESISTOR-FAULT LED should be off.
• Remove the test resistor and wait 5 seconds (20 seconds with Option S).
• **PASS:** The SE-325 should trip on RESISTOR FAULT.
• Connect the 100-kΩ resistor to R and G terminals.
• Set the RES switch to 100K.
• Press RESET.
• The RESISTOR-FAULT LED should be off.
• Remove the test resistor and wait 5 seconds (20 seconds with Option S).
• **PASS:** The SE-325 should trip on RESISTOR FAULT.

To test the connected wiring, sensing resistor, and NGR:
• Reconnect SE-325 R and G connections.
• Set the RES switch to match sensing resistor.
• Press RESET.
• **PASS:** The RESISTOR FAULT LED should be off.

7.2.2 VOLTAGE TEST
Test Equipment: 0 to 120 Vac voltage source and multimeter.

**NOTE:** Applying the test voltage to the R and G terminals will damage the SE-325 and the ER sensing resistor. The RES TRIP LEVEL is the trip voltage at terminal N, not terminal R.

Procedure:
• Check the ER sensing resistor connection to the SE-325.
• Disconnect the wire from sensing resistor terminal N.
• Set the voltage source to 0 V.
• Connect the voltage source between sensing resistor N and G terminals.
• Set the RES TRIP LEVEL (VAC) to 20.
• Press RESET.
• The RESISTOR-FAULT LED should be off.
• Increase the test voltage to 25 Vac for 20-kΩ sensors or 120 Vac for 100-kΩ sensors and wait 5 seconds (20 seconds with Option S).
• **PASS:** The SE-325 should trip on RESISTOR FAULT.

7.3 SENSING-RESISTOR TEST
Test Equipment: Multimeter.

Procedure:
• Disconnect the sensing resistor.
• Measure the resistance between sensing-resistor terminals R and N.
• **PASS:** Resistance should be between 19.6 and 20.4 kΩ for 20-kΩ sensing resistors. Resistance should be between 98 and 102 kΩ for 100-kΩ sensing resistors.
• Measure the resistance between sensing-resistor terminals R and G in both directions.
• **PASS:** Resistance should be greater than 10 MΩ in both directions.
