

# Lighting controls and solutions

Studio 3 – programmable modular lighting controls provide overall control in both Residential and Commercial industries.

Comprehensive range of lighting controls and scene setting solutions to cover small dimming applications to custom made lighting management systems.

## Studio 3 System – What is it and where can it be used?

Studio 3 is a two tier system in which installations are designed and installed using a 'building blocks' principle.

- On the first tier, local user control requirements such as manual, preset, scene and global control with the option of infra-red remote operation are all available.
- On the second tier, Remote Dimmer Packs are selected to interface with most available dimmable load types, including tungsten, tungsten halogen, compatible transformers of leading edge type, either resistive or inductive for low voltage and cold cathode lighting plus fluorescent luminaires fitted with compatible dimmable control gear, analogue or digital DSI types.
- Numerous control strategies can be achieved by using 'mix and match' approach with the various Studio 3 system components.
- Studio 3 can be used in a variety of locations: including hotels, restaurants, bars, corporate offices, galleries, houses and flats to name but a few!

## Litelink LSC Assembly and LDU Multi-outlet boxes

A simple, but effective plug-in system for the wall or ceiling lighting outlet ensures that when the plug or luminaire is removed, the unobtrusive outlet leaves no exposed live parts.

Litelink represents a significant advance in the safety and installation of lighting points. A complete 3 and 4 pin system complying with BS 7001.

Eaton's MEM LDU Multi-outlet boxes utilise the LSC 'plug-in' lighting interface allowing luminaires to be plugged in, providing safety without isolation of the circuit.

The LDU (Lighting Distribution Unit) incorporates 6 LSC outlets which accept both Eaton's MEM 3 and 4 pin LSC plugs.

Interchangeable front covers (6, 8 and 10) enables upgrade capacity.
