Eatons new electrohydraulic cylinder

Electrohydraulic cylinder featuring advanced feedback sensors and direct valve integration

MORGES, SWITZERLAND ... Power management company Eaton has today announced the launch of a new electrohydraulic cylinder featuring valve integration. The new product comprises a high-performance industrial cylinder, precision feedback transducer and control valve in one package to create a single-source solution which offers significant cost savings over custom assemblies.

“With our latest electrohydraulic cylinder, customers and distributors no longer need to buy and assemble multiple components,” said Andreas Kling, Business Development Manager Power & Controls Products, EMEA, Eaton. “Our new cylinder is a complete system with the customer’s valve of choice pre-mounted on the cylinder. By eliminating the need for separate manifolds, plumbing between control valves and cylinders, transducer mounting brackets and other complex arrangements, we’re providing the benefits of custom assemblies while reducing the complexity and cost.”
