General Description
Unloading relief valves are primarily used in hydraulic circuits incorporating accumulators where a pressure regulator is required to automatically unload the pump when the pressure reaches the pre-adjusted pressure setting of the valve.

When the pressure has dropped to approximately 85% of the valve setting the valve spool closes, thus diverting the pump delivery to the accumulator.

On the EURG models an integral check valve prevents return flow from the accumulator through the unloading valve; for the EURT model to provide this function a separate right angle check valve, model C2-815 (3/4”) or C2-825 (1 1/4”) must be provided.

These valves may also be used with a double pump to deliver a large volume of oil to the system at low pressure and a small volume at high pressure, serving the same function as a separate unloading valve and check valve.

Applications

1. Single pump/accumulator system

2. Double pump system

Note that the EURG1 model shown in both systems can be replaced by the EURG2 or an EURT* plus the external check valve

Operating Data

Max. Pressures
Pressure inlet and system ports. Up to 210 bar (3000 psi) dependent on model.

Tank ports
EUR*1 models. Up to 85% of inlet pressure.
EUR*2 models. Up to 5% of inlet pressure.

Pilot pressure port
EURT* models. Up to 210 bar (3000 psi) dependent on model.

Drain port
EUR*1 models. Drain must be connected to tank through a surge free line so there will be no back pressure at this port.
EURT2 models are internally drained and this port is not used.

Pressure Adjustment Range
See “Model Code”.

Hydraulic Fluids
All valves can be used with antiwear hydraulic oils, water-in-oil emulsions and water-glycols. Add prefix “F3” to model designation when phosphate ester (not alkyl-based) or chlorinated hydrocarbons are to be used.
The extreme operating viscosity range is from 860 to 13 cSt (4000 to 70 SUS), but the recommended running range is 54 to 13 cSt (245 to 70 SUS).

* To obtain optimum service life from both fluid and hydraulic system 65°C (150°F) normally is the maximum temperature except for water-containing fluids.

For further information about fluids see leaflet 694.

Contamination Control Requirements

Recommendations on contamination control methods and the selection of products to control fluid condition are included in Vickers publication 9132 or 561, "Vickers Guide to Systemic Contamination Control". The book also includes information on the Vickers concept of "ProActive Maintenance". The following recommendations are based on ISO cleanliness levels at 2 μm, 5 μm and 15 μm. For products in this catalog the recommended levels are:
Up to 210 bar (3000 psi) . . . . . 19/17/14

For synthetic fluids consult manufacturer or Vickers representative where limits are outside those for petroleum use.

Whatever the actual temperature range, ensure that viscosities stay within the limits specified in the “Hydraulic Fluids” section.

Ordering Procedure
Before ordering check availability with the Vickers representative. Valves, subplates and bolt kits are supplied as separate items and must be ordered as such, e.g.
2 off -EURG1-06-B-13-UG valves
2 off -EURG1M-06-20-R subplates
2 off -BKUR-682M bolt kits

If a EURT valve is required then a check valve is also needed and must be ordered separately. The check valves recommended are C2-815 (3/4") or C2-825 (1\(\frac{3}{4}")). For further details of these valves refer to leaflet 2334.
