

# Eaton's Electrical Sector and its cybersecurity team continue to evaluate the potential exposure of its products to the Heartbleed "bug"

Heartbleed refers to an implementation flaw in OpenSSL versions 1.0.1a through 1.0.1f and 1.0.2 beta that leak the contents of memory from the server to the client and vice versa, potentially exposing passwords, certificates and other sensitive data.

OpenSSL developers inadvertently introduced the flaw in the open-source code two years ago. The problem was discovered and reported by researchers at Google and Codenomicon in April of 2014.

SSL encrypts communication sessions on websites, virtual private networks, email and instant messaging. In order to keep SSL sessions alive, heartbeat messages are sent between the client and the server. These messages could potentially be exploited through the OpenSSL flaw.

Eaton has reviewed the included list of products and confirmed that they currently do not use the affected OpenSSL version.
