Unplug the ePDU during installation. Read and understand the safety manual before installation.

Read and understand the operator's manual before using this equipment.
The ePDU front panel includes communication and monitoring ports, LED status indicators, and operation buttons. The ports and the associated LED indicators are described in the following table.

The ePDU front panel includes communication and monitoring ports, LED status indicators, and operation buttons. The ports and the associated LED indicators are described in the following table.

**COMMUNICATION STATUS LEDs**

1. **Serial or Environmental Monitoring Probe (EMP) Port**
2. **Yellow Serial/EMP Port LED**: RS-232 Operation and Activity Status
   - Offline: No EMP connected
   - Flashing: EMP connected
3. **Green Serial/EMP Port LED**: ePDU Communication Status
   - Offline: ePDU start-up in progress
   - Flashing: eNMC module operational
4. **Ethernet 10/100 Base-T Port**
5. **Green Ethernet Port LED**: Operation Transfer Rate Status
   - Online: Port operating at 100 Mbps
   - Off: Port operating at 10 Mbps
6. **Yellow Ethernet Port LED**: Connection and Transmission Activity Status
   - Offline: ePDU not connected to the network
   - Online: ePDU connected to the network, but no activity
   - Flashing: Port is sending or receiving transmission (active)
7. **Reset Button**
   - Note: To restart the eNMC, insert a probe and press the button for 3 seconds (or until the LCD goes blank). This does not reset power to the outlets.
8. **USB Port**: Used for Firmware Upgrade
   - Note: Refer to the Eaton ePDU G3 Operation manual for more information.
9. **Daisy Chain Port**
10. **Yellow Daisy Chain Port LED**: Transmission Activity Status
    - Flashing: ePDU is transmitting data
11. **Green Daisy Chain Port LED**: Role Assignment in Communication Protocol
    - Online: Daisy
    - Flashing: Not Daisy Chain

**COMMUNICATION MANAGEMENT**

Eaton ePDU G3HD power distribution products have an ePDU Network Management and Control (eNMC) module that manages the ePDU communication interfaces. Basic network communication configuration must be performed before the Web or Command Line Interface (CLI) user interfaces can be accessed and used. This sheet describes how to set eNMC parameters and enable the module.

Groups of Eaton ePDU G3HD models can be configured or updated with new firmware at the same time using Eaton Intelligent Power Manager (IPM). The IPM software is available separately at no cost for up to 10 devices.

**NETWORK COMMUNICATION CONFIGURATION**

The network connection automatically receives an IP address through the Dynamic Host Configuration Protocol (DHCP) if available on the network. If a DHCP is enabled but a DHCP server is not available, the eNMC will fall back to the last-used IP address setting. Alternately, it is possible to set a static IP address by using either the LCD menu or a serial connection command line interface (CLI).

The default settings are:
- **DHCP**: Enabled
- **IP Address**: 192.168.123.123
- **Subnet Mask**: 255.255.255.0
- **Gateway**: 192.168.123.1
- **Username**: admin
- **Password**: admin

You can also connect up to four ePDUs together using the Daisy Chain port and an RJ-45 splitter (provided). This enables multiple ePDUs to communicate over one Ethernet port. Refer to the Eaton ePDU G3 operation manual for detailed instructions. View the operation manual online at: http://www.eaton.com/ePDU.

**SETUP USING THE LCD — DHCP**

1. The ePDU defaults to DHCP enabled when delivered.
2. Connect to a network that has a DHCP server and wait 20 seconds.
3. Obtain the IP address from the LCD home screen.

**SETUP USING THE LCD — STATIC IP ADDRESS**

1. In the terminal emulator session window, enter the default user name (admin) at the login prompt. For example:
   - Enter Login: admin
   - Enter Password: admin
2. Type `admin` (default) at the password prompt. Press Enter.
3. The CLI uses a "get" command to return the value of a setting and a "set" command to change the value of a setting. For example:
   - PDU#0>set System.Network.DHCP 0
   - PDU#0>get System.Network.DHCP
   - PDU#0>set System.Network.DHCP 0
4. Type `admin` at the login prompt. Press Enter.
5. Set the IP address to a value provided by your system administrator.
   - PDU#0>set System.Network.IPAddress xxx.xxx.xxx.xxx
5. If necessary, set the network Subnet Mask to the value required by your system administrator.
   - PDU#0>set System.Network.IPMask 255.255.yyy.yyy
6. Set the network Gateway to the value required by your system administrator.
   - PDU#0>set System.Network.IPGateway xxx.xxx.xxx.xxx
7. Set the network Gateway to the value required by your system administrator.
   - PDU#0>set System.Network.IPGateway xxx.xxx.xxx.xxx
8. Wait 10 seconds. Use the reset button to restart the eNMC and apply the new settings.
