High efficiency filter elements for hydraulic and lubrication oils
Proven solutions for long element life and consistent performance

Eaton’s hydraulic filtration product line features more than 4,000 high-quality filter elements with a high dirt-holding capacity to ensure consistent filter efficiency and long element life. These elements are available with various filter materials, different construction types and micron ratings to help protect critical system components.

Eaton’s wide range of filter elements provide trouble-free operation when filtering hydraulic fluids, cooling lubricants or water-based fluids and are designed to achieve cleanliness class requirements. Eaton can perform fluid analysis on-site or in our lab to determine the best filter element for your hydraulic and lubrication system requirements.

Features:
- High resistance to variable operating pressures and flow rates contribute to one of the highest dirt-holding capacities and filtration efficiencies on the market
- Filter elements contain more pleats and surface area than most competitors
- Consistent filter efficiency, even at high differential pressure

Benefits:
- Improved system protection
- Decreased number of maintenance operations
- Extended filter element life
- Customized solutions for specific filtration challenges
- Laboratory services
- Technical consulting and engineering support

Markets:
- Power generation
- Agriculture and construction
- Material handling
- Wind
- Oil and gas

Applications:
- Compressors
- Gearboxes
- Power units
- Lubrication modules
- Mobile hydraulics
- Factory equipment
01.E pressure filter elements
Nominal sizes: 30 – 1350
(435 psi/30 bar and 2,320 psi/160 bar)
These elements are ideal for use in medium and high pressure in-line filters to protect system components such as valves and hydraulic motors.

01.E return-line filter elements
Nominal sizes: 41 – 950
(232 psi/16 bar)
These elements are ideal for use in return-line filters to reduce the oil contamination in the hydraulic system.

01.E lubrication filter elements
Nominal sizes: 631 – 4001
(145 psi/10 bar)
These elements are ideal for use in larger lubrication filters to protect system components and reduce oil contamination.

01.NR return-line filter elements
Nominal sizes: 63 – 1000
(145 psi/10 bar)
These elements meet DIN 24550-4 standards and are ideal for use in return-line filters to reduce oil contamination.

01.NL in-line filter elements
Nominal sizes: 40 – 1000
(435 psi/30 bar and 2,320 psi/160 bar)
These elements meet DIN 24550-3 standards and are ideal for use in pressure filters to protect system components.

01.N in-line filter elements
Nominal size: 100
(232 psi/16 bar)
These elements are ideal for use in low pressure in-line filters to protect system components such as valves and hydraulic motors.

01.AS and TS suction filter elements
Nominal sizes: 180 – 631
These elements are ideal for use in suction filters to protect sensitive hydraulic pumps.

01.NBF breather filter elements
Nominal sizes: 25 – 125
These elements are ideal for use in tank breather filters to protect the hydraulic fluid from contamination in the ambient air.

01.WSNR Watersorp off-line filter elements
Nominal sizes: 250 – 1000
(145 psi/10 bar)
These elements are ideal for use in off-line filters to remove particles and water from the hydraulic system.
Eaton’s filter elements are designed to flow from the outside to the inside except for the AS and TS suction filter elements, which flow from the inside to the outside.

The nominal size of the filter element corresponds to the application flow rate in l/min at a filter fineness of \( \beta_{20 \mu m} \geq 200 \).

For oil conductivity below 300 pS/m we recommend specification IS27.

Example for product key: **01.NL 630.10 VG.30.E.P.-**

### Filter element type
- **Pressure filter elements**
- **Return-line filter elements**
- **Lubrication filter elements**
- **Return-line filter elements according to DIN 24550-4**
- **In-line filter elements according to DIN 24550-3**
- **In-line filter elements**
- **Suction filter elements**
- **Tank/Suction filter elements**
- **Breather filter elements**
- **Watersorp off-line filter elements**

### Properties
- **Series**
- **Nominal size**
- **Grade of filter fineness**
- **Filter material**
- **\( \Delta p \) resistance**
- **Design**
- **Sealing material**
- **Specification**

### Values
- **3 VG, 6 VG, 10 VG, 16 VG, 25 VG**
- **30, 60, 90, 150, 170, 240, 360, 450, 600, 900, 1350**
- **VG = microglass**
- **10 G, 25 G, 40 G, 80 G**
- **G = stainless steel wire mesh**
- **16 = 232 psi (16 bar)**
- **E = single open end, S = bypass valve with several opening pressure options**
- **P = Nitrile, V = Viton, others on request**
- **- = standard elements, IS06 = HFC applications, VA = stainless steel**

Filter element material layers

**Glass fiber fleece (VG)**
Multilayer, pleated construction made with synthetic glass fibers.

**Features:**
- High retention of fine contaminants while maintaining performance over the life of the element
- High dirt-holding capacity
- High stability to variable operating pressures and flow rates
- High collapse resistance for added protection

**Glass fiber fleece (API)**
Multilayer, pleated construction made with synthetic glass fibers.

**Features:**
- Low differential pressure design for lubrication applications
- Fulfills the requirements of API 614 standard

**Glass fiber fleece with absorption layer (WVG)**
Multilayer, pleated construction made with synthetic glass fibers.

**Feature:**
- Combines removal of solid contamination and water removal by using a microglass and a water absorption layer

**Stainless steel wire mesh (G)**
Single or multilayer, pleated construction made with stainless steel wire mesh in different weaves, depending on retention ratings.

**Features:**
- Removes particulate from coarse contaminated fluids
- Protects pumps with a minimal pressure drop decreasing the risk of cavitation
- Compatible with a wide range of fluid types

**Paper (P)**
Single layer, pleated construction made with organic cellulose fiber fleece used for flushing operations.
## Filter efficiency data

### Filtration quotient $\beta_{x \mu m(c)}$ for filter materials

![Graph of filtration quotient $\beta_{x \mu m(c)}$ for filter materials]

#### Multi-pass performance according to ISO 16889

**Calculation of the filtration quotient $\beta_{x \mu m(c)}$**

\[
\beta_{x \mu m(c) \text{ before filter}} = \frac{\text{amount of particles of the size } \geq x \mu m(c) \text{ before the filter}}{\text{amount of particles of the size } \geq x \mu m(c) \text{ after the filter}}
\]

**Conversion of filtration quotient $\beta_{x \mu m(c)}$ into filtration efficiency (in %)**

\[
\text{filtration quotient -1} \times 100 = \% \text{ filtration quotient}
\]

*E.g.*

\[
\beta_{10 \mu m(c)} = 200 \rightarrow \frac{(200-1)}{200} \times 100 = 99.5\%
\]

In addition to proprietary tests developed by Eaton, filter elements are tested according to several ISO standards:

- **ISO 2941** Verification of collapse/burst pressure rating
- **ISO 2942** Verification of fabrication integrity
- **ISO 2943** Verification of material compatibility with fluids
- **ISO 3723** Method for end load test
- **ISO 3724** Determination of resistance to flow fatigue using particulate contaminant
- **ISO 3968** Evaluation of pressure drop versus flow characteristics
- **ISO 16889** Multi-pass method for evaluating filtration performance

The cleanliness of the oil in a hydraulic system is determined by the micron rating of the filter element, the specific contaminant, and the size and distribution of the particles in the fluid.

This table presents standard data values. The quality of a particular oil can be determined using established analysis procedures.
