Section 1: Introduction

Description

Eaton’s ATC-900 brings intelligence, adaptability, supervisory and programming capabilities to automatic transfer switch equipment. The smartEST (smart Eaton Switch Technology) brings a new standard in Automatic Transfer Switches.

Extreme reliability makes the ATC-900 ideal for mission critical applications in healthcare, wastewater, data center and other industries. Typically used for utility-to-utility, utility-to-generator, generator-to-generator and three source transfer systems, the ATC-900 can address virtually any system requirements.

Ease-of-use is a major benefit of the ATC-900 controller. With a simple, powerful user interface, many intuitive operating features are included. LED indications and a TFT based color display provide high visibility. Simple arrow keys are used for quick screen navigation. No codes or abbreviations are used to avoid potential confusion and/or slow operation, and data screens are grouped for ease of viewing and edits.

The ATC-900 is available in one standard model that offers a variety of monitoring and control features such as selective and automatic load shedding, remote load testing, and event logging/recording. Flexibility is another important benefit, allowing field configurability and expandability in the future with add-on accessory modules and hardware. There is also an easy upgrade kit from the ATC-600/800 to the ATC-900.

1.1 Preliminary Comments and Safety Precautions

This technical document is intended to cover most aspects associated with the installation, application, operation, and maintenance of the ATC-900. It is provided as a guide for authorized and qualified personnel only in the selection and application of the ATC-900. Please refer to the specific WARNING and CAUTION in Section 1.1.2 before proceeding.

If further information is required by the purchaser regarding a particular installation, application, or maintenance activity, an Eaton representative should be contacted.
1.2 Background

Transfer switches are used to protect critical electrical loads against loss of power. The load’s normal power source is backed up by a secondary (emergency) power source. A transfer switch is connected to both the normal and emergency sources and supplies the load with power from one of these two sources. In the event that power is lost from the normal source, the transfer switch transfers the load to the secondary source. Transfer can be automatic or manual depending upon the type of transfer switch equipment being used. Once normal power is restored, the load is transferred back to the normal power source. The transfer switch, in this manual, could be a Power Frame Switch/Breaker, Molded Case Switch/Breaker, or a Contactor type.

In automatic transfer switch equipment, the switch’s intelligence system initiates the transfer when normal power fails or falls outside a preset threshold. If the emergency source is a standby generator, the transfer switch initiates generator starting and transfers to the emergency source when sufficient generator voltage is available. When normal power is restored, the transfer switch automatically transfers back and initiates generator engine shutdown.

An automatic transfer switch consists of three basic elements:

1. Main contacts to connect and disconnect the load to and from the source of power
2. A transfer mechanism to affect the transfer of the main contacts from source to source
3. Intelligence/supervisory circuits to constantly monitor the condition of the power sources and thus provide the intelligence necessary for the switch and related circuit operation

This document deals with the third basic element of the automatic transfer switch, the required intelligence/supervisory circuits. Prior to the introduction of ATC-900, this function was performed by a door mounted logic panel. The logic panel could be the relay logic type or the solid state logic type. In either case, the panel consists of a number of individually mounted and wired devices offering a limited amount of system flexibility, especially in the case of the relay logic design. The ATC-900 brings intelligence, supervisory and programming capabilities, never before available, to automatic transfer switch equipment.

1.3 Product Overview

The ATC-900 is a comprehensive, multi-function, microprocessor-based automatic transfer switch controller. It is a compact, self-contained, panel mounted device designed to replace traditional relay and solid state logic panels (Figures 2 and 3). Designed to meet the needs of markets worldwide, the ATC-900 meets the following standards:

- ULT 991 Effects of shipping and storage test
- Thermal cycling test
- Humidity test
- UL 1008 Dielectric test
- FCC Part 15 Conducted/radiated emissions (Class B)
- CISPR 11 Conducted/radiated emissions (Class A)
- IEC 61000-4-2 Electrostatic discharge test
- IEC 61000-4-3 Radiated susceptibility tests
- IEC 61000-4-4 Fast transient tests
- IEC 61000-4-5 Surge withstand tests
- IEC 61000-4-6 Conducted immunity tests
- IEC 61000-4-11 Voltage dips and interruptions
- IEC 61000-3-2 Harmonics
- IEC 61000-3-3 Voltage flicker/fluctuation
- Seismic IBC/CBC certified
- CSA conformance C22.2 No. 178-1978 (reaffirmed 1992)

The ATC-900 provides an unmatched degree of programmed flexibility to address the needs of any system. It operates from most system voltages available worldwide at 50 or 60 Hertz (and 24 VDC using the CT Module option). In addition, a period of no control power operation is provided. The ATC-900 monitors the condition of the 3-phase line-to-line voltage and frequency of both the Normal and Emergency sources. It can also be programmed for single-phase operation. The ATC-900 provides the necessary intelligence to insure that the switch operates properly through a series of programmed sensing and timing functions.

The ATC-900 will form fit into the opening of the ATC-600/800 and an easy upgrade kit is available for previous switch wiring.

A standard ATC-900 will:
- Monitor Normal and Emergency source voltages and frequencies
- Provide second to none Event Summary, Hi-Speed Capture, and History information
- Permit customer programming including I/O
- Display real time and historical information through a color 4.5 inch TFT display
- System diagnostics through the display
- All I/O are available to the user
- Features are opened to user
- Provides serial communications (Modbus RTU) and a USB port.
- Ethernet communication optional.
- Provide faceplate source/load status indications (MIMIC bus)

1.4 Functions/Features/Options

The primary function of ATC-900 is to accurately monitor power sources and provide the necessary intelligence to operate a transfer switch in an appropriate and timely manner. In addition, ATC-900 provides useful present and historical data, reliable two-way communications, and programming through the device’s faceplate or communications. ATC-900 features digital signal processor (DSP) technology to provide and maintain superior precision and versatility during both programming and data access.

1.4.1 Operational Simplicity

From installation, to programming, to usage, the ATC-900 was designed with operational simplicity in mind. Only one style needs to be considered, regardless of input/output requirements or system voltages and frequencies. ATC-900 provides the functionality of numerous other devices combined in one package that mounts in less than 7 by 11 inches of panel space.

The user friendly front panel interface simplifies routine operation, programming, data presentation and setting adjustments. A large color display provides flexibility and ease of use. The operation of front panel membrane pushbuttons moves the ATC-900 display from function to function or step to step within menus. A single LED at the top of the faceplate provide an immediate indication as to the device’s operational mode. An integrated Help Mode provides immediate user assistance in the form of English language message displays through the use of a front panel help pushbutton.

The ATC-900 is communications ready, including Modbus 485, Ethernet (External), and USB for thumb drives (memory sticks).
1.4.2 Standard and Optional Features

A variety of programmable features are available to meet a wide array of application requirements. Individual features or feature combinations provide the information required to tailor switches to individual needs.

Unlike earlier controllers, the ATC-900 comes with standard features that are ready to use, with the exception of Closed Transition, Current metering, and Ethernet. Another advancement is that there are four (4) standard inputs and four (4) standard outputs that the operator can easily program by choosing from a wide array of predefined functions. Additional inputs and outputs can be added in groups of four (4) up to sixteen (16) for a maximum of twenty (20) in total. The inputs are DC wetted (24 Volts at 10 ma) connections for various functional inputs.

1.5 Glossary of Terms and Features

NOTICE

WITH RESPECT TO THEIR USE IN THIS DOCUMENT AND AS THEY RELATE TO AUTOMATIC TRANSFER SWITCH OPERATION, THE FOLLOWING WORDS OR PHRASES ARE DEFINED.

Available
A source is defined as available when it is within its undervoltage/overvoltage/underfrequency/overfrequency/unbalance (if applicable) setpoint ranges for the nominal voltage and frequency setting.

Unavailable
A source is defined as failed when it is outside of its undervoltage/overvoltage/underfrequency/overfrequency/unbalance (if applicable) setpoint ranges for the nominal voltage and frequency setting.

Normal Source
The Normal Source is defined as the source that is preferred. The Preferred Source setting allows the operator to select Source 1, Source 2 or NONE as the Preferred Source. If NONE is chosen, the Preferred Source or the Normal Source will be the source that is presently attached to the load. The default is set as being Source 1 as the Preferred and Normal Source.

Emergency Source
The Emergency Source is defined as the source that is not preferred. If NONE is chosen for the Preferred Source setting, the Emergency Source will be the source that is presently not attached to the load. Therefore, in this condition after a transfer, the Normal and Emergency Sources will switch between Source 1 and 2.

1.5.1 Features

The ATC-900 has many features that are available to the user. These features are standard and are available depending on the type of transfer switch used (i.e. Contactor, Power Frame Switch/Breaker, or Molded Case Switch/Breaker, 2 or 3 position). Appendix A has a list of all of the features including any acronyms used along with a brief description. The feature numbers correspond to the internal codes and some of these numbers may be on the product drawings. See Table 7 "ATC-900 Features" for a compact list of features, including a full list of available I/O. Consult Appendix B for I/O descriptions. For some transfer switch configurations, standard input(s) and/or standard output(s) will be fixed at the factory to support system functionality and will not be programmable in the field. An example of this is Service Entrance; which requires Go To Neutral to be a fixed input. The programmable I/Os are covered in Section 5.

The only item that is optional for the transfer switch is the closed transition optional feature. The closed transition operation is covered in section 1.5.3

1.5.2 In-Phase Operation

The In-Phase operation of an Automatic Transfer Switch is an open type transfer. It will allow a transfer between two available sources if the phase angle has a difference of five degrees or less. See section 1.5.4. Appendix A (32C, 32D, 32F) shows detailed descriptions of the different scenarios that can be performed using In-Phase.

As shown in the feature list of Appendix A for In-Phase, there are three scenarios for In-Phase:

32C = In-Phase default to Load Voltage Decay
32D = In-Phase default to Time Delay Neutral
32F = In-Phase

The user setpoints for In-phase transition are similar to this:

• Disabled (In-Phase not used)
• Alarm on Synchronization Fail (Will not switch and will show an alarm)
• Fallback to Open on Synchronization Fail (To TDN or LVD)

For example, with the setpoint at Fallback, using a two position contactor, the switch will transfer, if no synchronisation occurs, to the other source. The three position will allow the use of TDN or Load Voltage Decay.

1.5.3 Closed Transition Operation

Several Options for Closed Transition

Once an ATS is in the field, other uses or changes may occur that could require changes from the original requirements. One area is the closed transition type switches. An application may initially require that only a closed transition should be used and if it does not synchronize because of maybe frequency, then the switch will not switch to the other source and will show an alarm signalling this issue. If the requirements now have change, for example, and the switch must now transfer using open transition if closed does not occur; instead of sending the controller back to the factory for reprogramming, one can easily change the user setpoints to accomplish any scenario. One may go from closed transition directly to Time Delay Neutral for example. All options are available to the user.

If closed transition is available on the switch, the user will receive 47 D and all of the other options 47 C, E, F, G which can be changed by the setpoints to disable or enable the functions (see below). Screen 3 of 3 in the System Setup menu (See section 3.4.1) is where the user will set the transition types of the switch. If the switch can perform closed transition the user will set up the setpoints depending on the scenario required as shown below.

Closed Transition to Alarm (47D) or by changing the setpoints,
Closed Transition > In-Phase > TDN
Closed Transition > In-Phase > LVD
Closed Transition > TDN
Closed Transition > LVD

The user can disable closed transition and just use the following:

In-Phase > TDN
In-Phase > LVD

For more information visit: www.eaton.com
Also with Closed Transition and In-Phase disabled:

- TDN or LVD
- The user setpoints for closed transition are similar to this:
  - Disabled (Closed transition not used)
  - Alarm on Synchronization Fail (Will not switch and will show an alarm)
  - Fallback to Open on Synchronization Fail (To in-phase, TDN, and/or LVD)

For In-Phase and Closed transfers, the phase difference between sources (synchroscope) is displayed with the ATC-900’s Sync Time countdown message.

**Feature 47C: Closed/In-phase Transition/Load Voltage Decay**

Closed Transition is a feature that will temporarily parallel two live sources in a make-before-break scheme when performing a transfer. This achieves a transfer between sources with no power interruption. Both sources must be synchronized in frequency, phase, and voltage before the transfer is initiated.

In-phase transition is a feature that will allow a transfer between two live sources only when the phase difference between the two sources is near zero. This is an open transition transfer that prevents in-rush currents from exceeding normal starting currents in the case where motor loads are being transferred.

Load Voltage Decay utilizes the load voltage measurements to sense back EMF that is generated when the transfer switch is in the neutral position. It provides a delay in transfer in either direction if an unacceptable level is sensed as established by a customer programmed level. The transfer will not take place until the back EMF decays below the acceptable programmed level. This feature has a separate setting of enabling or disabling the operation. If disabled, the transfer switch will not delay in the neutral position and will transfer between the sources as fast as possible.

**Feature 47D: Closed Transition Only**

Closed Transition is a feature that will temporarily parallel two live sources in a make-before-break scheme when performing a transfer. This achieves a transfer between sources with no power interruption. Both sources must be synchronized in frequency, phase, and voltage before the transfer is initiated. If the two available sources do not synchronize in a certain settable sync time, the switch will not transfer and an output alarm will be present as well as a red flashing banner on the controller stating; Failed to Sync - (Frequency, Voltage, or Phase angle)

If the logic is forced into a fail safe mode (i.e. loss of connected source), the logic will perform an open transfer.

**Optional Feature 47E: Closed/In-Phase Transition/Time Delay Neutral**

Closed Transition is a feature that will temporarily parallel two live sources in a make-before-break scheme when performing a transfer. This achieves a transfer between sources with no power interruption. Both sources must be synchronized in frequency, phase, and voltage before the transfer is initiated.

In-phase transition is a feature that will allow a transfer between two live sources only when the phase difference between the two sources is near zero. This is an open transition transfer that prevents in-rush currents from exceeding normal starting currents in the case where motor loads are being transferred.

Time delay neutral provides a time delay in the transfer switch neutral position when both breakers/contactors are open. This delay takes place when the load is transferred in either direction to prevent excessive in-rush currents due to out of phase switching of large motor loads.

**Feature 47F: Closed/Load Voltage Decay**

Closed Transition is a feature that will temporarily parallel two live sources in a make-before-break scheme when performing a transfer. This achieves a transfer between sources with no power interruption. Both sources must be synchronized in frequency, phase, and voltage before the transfer is initiated.

Time Delay Load Voltage Decay utilizes the load voltage measurements to sense back EMF that is generated when the transfer switch is in the neutral position. It provides a delay in transfer in either direction if an unacceptable level is sensed as established by a customer programmed level. The transfer will not take place until the back EMF decays below the acceptable programmed level. This feature has a separate setting of enabling or disabling the operation. If disabled, the transfer switch will not delay in the neutral position and will transfer between the sources as fast as possible.

**Feature 47G: Closed/Time Delay Neutral**

Closed Transition is a feature that will temporarily parallel two live sources in a make-before-break scheme when performing a transfer. This achieves a transfer between sources with no power interruption. Both sources must be synchronized in frequency, phase, and voltage before the transfer is initiated.

Time delay neutral provides a time delay in the transfer switch neutral position when both breakers/contactors are open. This delay takes place when the load is transferred in either direction to prevent excessive in-rush currents due to out of phase switching of large motor loads.

**Optional Feature 29G: Type of Operation (Selectable Automatic or Non-Automatic)**

This feature provides two door mounted selector switches marked Auto/Manual and S1-Trip-S2 which permits the selection of automatic or manual operation. In manual operation, the user can manually initiate and electrically operate between S1, Trip, or S2. On the Contactor Bypass’s, 29G uses the top switch and the bottom switch. The newer contactor bypasses (some starting in 2018) have 29G integrated and standard for either the ATS or the Bypass contactors. See the switch instruction booklet for operating instructions. The controller is in Monitor Mode during the manual operation meaning the controller will not attempt to change the switch position but will monitor the voltage availability and the switch positions. The ATC-900’s display will show “MONITOR”.

For more information visit: [www.eaton.com](http://www.eaton.com)
1.5.4 How the ATC-900 evaluates Closed or In-phase transitions

The controller software will confirm that the Closed Transition (CT) or In-phase transition is enabled through the set-points. When Source 1 and Source 2 are both Available within voltage and frequency set point tolerances:

- If S1 and S2 set points (UV/OV, UF/OF) are identical, there can be a difference in voltage and/or frequency when transition occurs. Also, if there is a difference in setpoints, the actual voltage and/or frequency may be identical when the transition occurs.
- It confirms that sources are within Closed or In-phase transitions set point tolerances when:
  - Voltage difference for Closed = +/- 1 to 5%,
  - There is no voltage difference setpoint for In-phase. As long as both voltages are with in voltage limits any difference in acceptable
  - Freq. difference = +/- 0 to 0.3 Hz for closed
  - Freq. difference = +/- 0 to 3 Hz for In-phase
  - Phase Angle closed or in-phase, when the number of Generators = 0, the phase angle difference is fixed at +/- 8 degrees
  - Phase Angle closed or in-phase, when the number of Generators = 1 or 2, the phase angle difference is fixed at +/- 5 degrees
- The controller attempts to close or in-phase transition until the Sync Timer’s set point (1 to 60 min) expires.

Synchroscope Data for In-phase & Closed Transitions

The synchroscope is a useful tool for sync type transitions. When the controller is waiting for synchronization for either In-phase or Closed transitions, there is a timer countdown and the display will show the following:

<table>
<thead>
<tr>
<th>Phase Angle</th>
<th>xxx degrees</th>
<th>Sync Timer</th>
<th>hh:mm:ss</th>
</tr>
</thead>
</table>

The phase angle is between 0 and 365 degrees. On each closed transition type switch, there is a parallel limit timer that either opens the breaker or sends a close to user terminal blocks (contactor types) that can be used to open breakers upstream, if the overlap time is greater than what was set by the user. Please check the switch instruction booklet for more information.

Section 2: Hardware Description

2.1 General

The purpose of this section is to familiarize the reader with ATC-900 hardware, its nomenclature, and to list the unit’s specifications. The information presented is divided into the following four parts:

- Operator Panel;
- Rear Access Area;
- External Hardware; and
- Specification Summary.

2.2 Operator Panel

The operator panel, which is normally accessible from the outside of a panel or door, provides a means for:

- Being alerted to specific conditions;
- Receiving functional help;
- Programming; and
- Parameter Monitoring/Selection/Metering.

LEDs, a display, pushbuttons, and a mimic bus make up the front accessible operator panel (Figure 1).

The Color high resolution TFT LCD is used to display all ATC-900 monitored parameters, setpoints and messages in an easy to read format. The display is approximately 2.25” x 4” (57.15mm x 101.6mm). The TFT display is not a touch screen.

The front operator panel supports seven long-life extended temperature membrane pushbuttons.

2.3 Rear Access Area

The rear access area of the ATC-900 is normally accessible from the rear of an open switch panel door (Figure 2).

All wiring connections to the ATC-900 are made at the rear of the chassis. For the sake of uniform identification, the frame of reference when discussing the rear access area is facing the back of the ATC-900 with the panel door open. Keeping safety in mind, programming and downloading setpoints, history, and events can all be accomplished with the front door closed. A USB connector with a cover is brought out from the back of the controller to the front of the door on the switch using the device panel.

2.3.1 Connections on Chassis

The rear access area of the ATC-900 is normally accessible from the rear of an open switch panel door (Figure 2).

All wiring connections to the ATC-900 are made at the rear of the chassis. For the sake of uniform identification, the frame of reference when discussing the rear access area is facing the back of the ATC-900 with the panel door open. Keeping safety in mind, programming and downloading setpoints, history, and events can all be accomplished with the front door closed. A USB connector with a cover is brought out from the back of the controller to the front of the door on the switch using the device panel.

2.3.2 Connector Designation

See Figure 2 for connections for the left, right, and top of the ATC-900. See Section 4 for more information on input functionality. The part numbers of the connectors are shown below:

2. **Operational Mode LEDs** (highlighting ATC-900’s present operational condition)

3. **System Status Mimic Bus** (easy-to-read and understand LED type)

4. **Color Display Window** (easy-to-read monitored parameters, setpoints, and messages)

5. **Bypass Timer** (used simultaneously to bypass timers such as TDNE, TDEN, and TDEC)

6. **Help Pushbutton** (provides help information in any operational mode)

7. **Arrow Pushbuttons** (used individually, pushbuttons move through displayed information and adjust settings up or down through all possibilities)

8. **Lamp Test** (test all LEDs on the mimic bus #3)

9. **Enter Pushbutton** (used to enable the screen selections)

10. **Engine Test Pushbutton** (used to start/stop a self-test)

---

**Figure 1. ATC-900 Operator Panel.**
2.5 External Hardware

External hardware is viewed as any optional device mounted directly to or remotely from the ATC-900, such as a DCT Module, I/O Module, or an Ethernet device. Since the ATC-900 is always supplied with the necessary communications ports, these modules can be retrofitted to the ATC-900 at any time. It is recommended that the control power to the ATC-900 (J7) be removed prior to connecting or disconnecting the modules. See Figures 2, for connections and section 2.5.2 for interface connections.

2.5.1 DCT Module Description (Integrated Metering)

The DCT (Direct Current-Current Transformer) Module is a current transformer interface to the ATC-900 allowing current to be metered along with voltage and frequency that is already integrated into the controller. The DCT Module simply secures to the ATC-900 back using four #8 x less than 1/2 inch screws. With the DCT module installed, the depth of the two units is 3.60 inches. The ribbon cable then plugs into J14 (see Figure 3). When equipped with a DCT module and CTs, the ATC-900 serves as a multifunction power meter and provides multifunction measurement of most electrical parameters including voltage, current, power, frequency, energy, etc. The meter capabilities is specified as a 1% class energy meter. The information is displayed on the color display on the front of the ATC-900. Readings can also be monitored through the RS-485 modbus on the controller. The DCT is used to measure load current when selective load shed is enabled.

The DCT Module also has a 24 Vdc input for powering the ATC-900 controller. If 120 VAC and 24 Vdc is supplied to the controller simultaneously, then the 120 Vac will be the powering supply. 61F is an option to add a DCT module and a 24VDC power supply with a power buffer. This will allow the controller to stay on over 20 seconds when power is removed, more than enough time to ride through the power loss. The controller will then be able to continue to communicate over ie, the Modbus.

The following Table 1 is a list of readings and accuracy available on the display. Accuracy is for 5 amp secondary WYE or Delta connections. The meter was tested at the full range of temperatures. The accuracies stated are for the meter components (DCT Module and ATC-900) only, not the CTs. CTs can be ordered with different accuracies (typically in the 1-2% range). Accuracy also can be affected by the CT not being in the correct range of the current being measured, i.e. using a 600:5 CT for a 400 amp application. Although not a revenue meter, the measurements are highly accurate for most applications.

Voltage Inputs (Measurement Category)

- Range: Universal, Auto-ranging up to 416 Vac L-N, 721 Vac L-L
- Supported hookups: 3 Element Wye, or Delta
- Input Impedance: 2 MOhm/Phase
- Burden: 0.0072 VA/Phase at 120 Volts
- Fault Withstand: Meets IEEE C37.90.1

Current Inputs

- 5 A Nominal, 5 A Maximum
- Burden: 0.0115 VA per Phase max at 5A
- Pickup Current: 0.1% of Nominal
- Connections: Screw Terminal
- Fault Withstand: 100 A/10 sec., 300 A/3 sec., 500 A/1 sec.

Isolation

- All inputs are isolated to 2600 Vac

Measurement Methods

- Voltage, Current: True RMS
- Power: Sampling at 64 Samples per Cycle on All Channels Measured Readings Simultaneously
- A/D Conversion: 16 simultaneous 12 bit Analog-to-Digital Converters

Mechanical Parameters

- Depth: 1.58"
- Total depth including controller is 2.60" + 1.58" = 4.18 C Total

Compliance

- UL Listing: E38116, Vol.3, Sec. 18

2.5.2 I/O Module Description
The I/O Module is an extension of the ATC-900 controller’s programmable inputs and outputs. Each I/O Module has four inputs and four outputs. The inputs are DC wetted (24 Volts at 10 ma) connections for various functional inputs. See Figure 4 and Figure 5. Up to four modules can be used with the ATC-900 giving the user up to 20 inputs or 20 outputs (including the controller’s standard I/Os). Depending on the options selected with the transfer switch, some of the I/Os may be required to be fixed from the factory so that the user cannot change that particular input or output. An example may be for Service Entrance, where the “Go To Neutral” must be a fixed input. The Fixed I/Os will usually be on the ATC-900’s I/O pins (wired to a terminal block). See Table 8 in Section 5.5 for the Features that relate to the switch type. Section 5.5 will also have instructions on how to set the I/O functions required for an application. The module(s) are interfaced to the controller using 485 communications with the address selected on the front of the unit. Each I/O Module requires 120 Vac for power. The I/O Module’s Control power on J1-1,2 and J1-3,4 for S1 and S2 respectively, must be electrically isolated from each other. Most transfer switch configurations have the power connector already included in the harness for two I/O Modules. If the ATC-900 is powered by 24 Vdc, and the power is removed from the switch, the I/O module will not communicate to the ATC-900. A warning will be shown on the ATC-900. If the ATC-900 is powered by 24Vdc, keep in mind that the I/O modules are powered with 120VAC. If an input or output is required when the 120VAC is not available, then those signals should be installed on the ATC-900’s I/Os. A 24VDC inverter could also be installed to produce 120VAC. The I/O Module’s dimensions are 4.41” wide x 5.74” long x 3.14” deep. A CAT V cable is used to hook the I/O modules (Figure 5). The input contact provides a wetted 24 Vdc at 10 mA. The output relay contacts are rated for 10 A, 1/3 HP @ 250 Vac. The DC rating is 10 A @24 Vdc.

2.5.3 Ethernet Module Description
The Ethernet Communications Module is an optional accessory that operates as a communicating device in conjunction with the ATC-900 via an Ethernet network. The Ethernet Module provides Ethernet TCP/IP. The J12 connection will be utilized for the Ethernet Module.

2.5.4 USB Port
Every ATC-900 transfer switch includes a front panel, NEMA 4X rated, USB port for use in uploading/downloading set points and historical data to a USB flash drive. The connector is on the device panel and has a flip down cover. Setpoints can be preconfigured and saved on the flash drive to reduce the time spent on-site for commissioning. Setpoints can quickly be copied from one ATS and uploaded to another. No laptop is required. Downloading event data provides the ability to more thoroughly analyze information using a PC. Data can be quickly e-mailed when offsite troubleshooting support is required. See Section 7.1 for downloading event data.

2.5.5 HMI Remote Annunciator and Controller (RAC)
The HMI Remote Annunciator and Controller is an optional accessory that monitors and controls up to eight transfer switches on a 7” LCD touchscreen. It is compatible with either Modbus RTU or Modbus TCP/IP protocols. A basic mimic bus for each transfer switch displays source availability, source connected and preferred source. Users can drill down to metered source values and event history for each transfer switch. Users can also change setpoints and do many of the functions remotely instead of being in front of the switch. All control features are password protected and include engine test, transfer to emergency (peak shaving), manual retransfer and bypass time delays.

Figure 6. Dimensions. Depth of 3.60 inches with DCT module installed.
Section 3: Operator Panel and Display Menus

3.1 General
The operator panel, which is normally accessible from the outside of a panel or door, provides a means for being alerted to specific conditions, receiving functional help, programming, and parameter monitoring/selection (Figure 1). For the purpose of familiarization, the panel is divided into three sub-sections and discussed individually:

- LEDs
- Pushbuttons
- Color Display Window (not a touch screen).

3.2 LEDS
LEDs are used to indicate the device's mode of operation, the status of the system, and the operations and/or conditions of displayed functions. The LED at the top of the ATC-900 provide a quick snapshot of the unit's status (Mode). Six LEDs, just above the display window, indicate which portions of the mimic bus are active, and the actual status of both sources and load.

Unit Status LED
This LED blinks green indicating that the ATC-900 is operating and providing the transfer switch control function in keeping with programmed setpoints. If the LED is not lit or is on continuously, a problem may be indicated.

Source 1 Available - Status LED
This LED is lit white if Source 1 meets the criteria for programmed Source 1 setpoints.

Source 1 Preferred - Status LED
This LED is lit green if Source 1 is the preferred source choice.

Source 1 Connected - Status LED
This LED is lit green if Source 1 is connected. This is accomplished by sensing the Source 1 breaker/contactor via the S1 closed auxiliary contact.

Source 2 Available - Status LED
This LED is lit amber if Source 2 meets the criteria for programmed Source 2 setpoints.

Source 2 Preferred - Status LED
This LED is lit green if Source 2 is the preferred source choice.

Source 2 Connected - Status LED
This LED is lit red if Source 2 is connected. This is accomplished by sensing the Source 2 breaker/contactor via the S2 closed auxiliary contact.

3.3 Pushbuttons
The front operations panel supports seven blue membrane pushbuttons. Pushbuttons accomplish their function when pressed and released. Certain pushbuttons, like the up, down, left, and right Arrows, will also continue to scroll if they are pressed and not released.

3.3.2 Help Pushbutton
When the Help pushbutton is pressed and released with the ATC-900 in any mode, the display will show a message. Messages and explanations relative to what is being viewed in the display are intended to prompt and assist the operator.

Pressing the Help and Enter pushbutton at the same time will allow the user to bypass the timers including Time Delay Normal to Emergency, Time Delay Emergency to Normal, Time Delay Neutral, and Engine Cooldown.

3.3.3 Engine Test Pushbutton
A self test is initiated when the Engine Test pushbutton is pressed and the controller password is entered. Pressing the Engine Test pushbutton again while in the engine run condition aborts the test. Upon test initiation, a generator start of the non-preferred source is engaged after the Time Delay Engine Start timeout. If a full test is programmed, a transfer with all programmed times occurs. The ATC-900 includes a unique set of independently programmable time delays activated during a test. The test engine run timer will hold the load for the required timeout and the test is concluded with a re-transfer cycle. For an engine run only test, no transfer will occur and the engine will run for the programmed run time.

3.3.4 Enter Pushbutton
The Enter pushbutton allows the user to select different areas of the display after arrow buttons move to the area of need.

3.3.5 Up, Down, Left, and Right Arrow Pushbuttons
These pushbuttons are used for system navigation through menus. They are also used when selecting and changing setpoints. They may be pressed and released for step-by-step changes or held down for continuous scrolling.
3.4 Display and Menus

The ATC-900 provides a comprehensive array of monitored parameters, setpoints, and messages via its easy to read Color Display Window.

NOTICE
WHETHER VIEWING OR PROGRAMMING, THE DISPLAY GOES TO THE HOME SCREEN IF NO PUSHBUTTON ACTIVITY IS DETECTED FOR APPROXIMATELY TWO MINUTES.

3.4.1 Color Display

The color display, under Main Menu contains six main top level functions. See Figure 7a. Remember, the display is not a touch screen; one must use the push buttons below the screen. This particular screen is showing 120 volts single phase and both of the sources are available.

From these top level menus, one can navigate through the features. Section 5 shows how to program setpoints and I/Os. Section 7 shows how to view and download Historical Data and Events, setpoints, and firmware by using a thumb drive (memory stick). See Appendix A for Status Display Messages. Below is a map of the Display Menus.

Main Menu (Figure 7a)

Load Metering - View Setpoints - Change Setpoints - Historical Data - System Info - USB Menu

1. View Setpoints System
   a. Screen 1 Setpoints - System Setup (1 of 4)
      i. Language
      ii. Frequency
      iii. System Voltage
      iv. Number of Phases
      v. Generators
      vi. Preferred Source
      vii. PT Ratio
      viii. CT Ratio
      ix. Automatic DST
      x. Time Sync
      xi. Time Zone Offset
      xii. Lead/Lag Sign
      xiii. CT Connection
   b. Screen 2 Setpoints - System Setup (2 of 4)
      i. Operating Mode
      ii. Phase Sequence Check
      iii. Commit to Transfer
      iv. Manual Retransfer
      v. Modbus Address
      vi. Modbus Configuration
      vii. Modbus Writes
   c. Screen 3 Setpoints - System Setup (3 of 4)
      i. Closed Transition (No Sync to Alarm or Open)
      ii. Frequency Diff
      iii. Voltage Diff
      iv. In-Phase Transition (No Sync to Alarm or Open)
      v. Frequency Diff
      vi. Sync Timer
      vii. Time Delay Neutral (TDN)
      viii. Load Decay
   d. Screen 4 Setpoints - Switch Type Settings (4 of 4)

2. View Setpoints Time Delays
   a. Screen 1 Setpoints Transfer Time Delays
      i. TD Normal to Emergency
      ii. TD Emergency to Normal
      iii. TD Pre-Transfer
      iv. TD Post Transfer
      v. TD Normal Disconnect
      vi. TD Normal Reconnect
      vii. TD Emergency Disconnect
      viii. TD Emergency Reconnect
   b. Screen 2 Setpoints Generator Time Delays
      i. Time Delay Engine Start
      ii. Time Delay Engine Cool
      iii. Time Delay Engine Fail

3. View Setpoints Dropouts/Pickups
   a. Screen 1 Setpoints Voltage Limits (1 of 3)
      i. Undervoltage Dropout
      ii. Undervoltage Pickup
      iii. Overvoltage Dropout
      iv. Overvoltage Pickup
   b. Screen 2 Setpoints Frequency Limits (2 of 3)
      i. Underfrequency Dropout
      ii. Underfrequency Pickup
      iii. Overfrequency Dropout
      iv. Overfrequency Pickup
   c. Screen 3 Setpoints Negative Sequence (3 of 3)
      (Not available for single-phase systems)
      i. Voltage Unbalance Dropout
      ii. Voltage Unbalance Pickup
      iii. Voltage Phase Loss Dropout
      iv. Voltage Phase Loss Pickup
      v. Current Unbalance Dropout
      vi. Current Unbalance Pickup
      vii. Current Unbalance Enable Threshold
      viii. Dropout Time Delay.Voltage Unbalance Dropout (Source 1 Source 2)

4. View Setpoints Engine Test/PE
   a. Screen 1 Setpoints - Engine Test/Plant Exercisers (1 of 3)
      i. Engine Test Mode
      ii. Engine Test Run Time
      iii. TD Normal to Emergency
      iv. TD Emergency to Normal
      v. TD Engine Cool
   b. Screen 2 Setpoints - Plant Exerciser 1 (2 of 3)
      i. PE1 Test Mode
      ii. PE1 Run Time
      iii. Schedule
      iv. Start Time
      v. PE1 Day
      vi. Exerciser 1 Dates
   c. Screen 3 Setpoints - Plant Exerciser 2 (3 of 3)
      i. PE2 Test Mode
      ii. PE2 Run Time
      iii. Schedule
      iv. Start Time
5. **View Setpoints Prog I/O**
   a. Screen 1 *Setpoints Programmable Inputs (1 of 2)*
      i. Main Input 1
      ii. Main Input 2
      iii. Main Input 3
      iv. Main Input 4
      v. Number of Accessory I/O Modules
   b. Screen 2 *Setpoints Programmable Outputs (2 of 2)*
      i. Main Output 1
      ii. Main Output 2
      iii. Main Output 3
      iv. Main Output 4

6. **Change Setpoints**
   a. Screen 1 Enter Password (0900)
      The Change Setpoints screen contains the same menus as the View Setpoints screen, above except that, after the correct password is given, the user can change the setpoints.

7. **Historical Data**
   a. Event Summary
   b. Event Details
   c. Hi-Speed Captures
   d. Event Data

8. **System Info (Figure 7b)**
   a. Style
   b. Transitions
   c. GO Number
   d. Serial Number
   e. Fixed I/O
   f. Firmware Versions
   g. Time & Date

9. **USB Menu**
   a. Save Setpoints
   b. Load Setpoints
   c. Save Statistics
   d. Save Events
   e. Save Hi-Speed

There are deeper menus (ie, Prog I/O) but they will be discussed in sections 5 and 7. Section 5 is "Setpoint Programming and I/O Programming. Section 7 is "Historical & Event Display". Figure 7b shows the System Info screen. System information is shown including the GO#, Style number, and revisions. The Set Time & Date button provides time/date change.

The color display also features a status bar that appears across the top whenever any of the following conditions are present:
- **Currently Active Controller Features** (e.g. Emergency Inhibit, Engine Test, etc.)
- **Currently Active Alarms** (banner turns red)

Appendix A shows a list of Status Display Messages.
Section 4: Operation

4.1 General
This section specifically describes the operation and functional use of the ATC-900. It is divided into three main categories:
- Automatic Mode;
- Test Mode; and
- Programming Mode.

The practical use and operation within each specific category will be discussed in this section. It is assumed that prior sections were reviewed and that the operator has a basic understanding of the hardware. It is important that the operator have a good grasp of the functional use of the operator panel as covered in Section 3. This will make movement within each category and between categories a simple task. This familiarity will quickly put the surpassed capabilities of ATC-900 at the operator’s fingertips.

4.2 Automatic Mode
The Automatic Mode of ATC-900 provides for automatic transfer and re-transfer from source to source as dictated by the features supplied and their programmed setpoint values. It provides a summary of ATC-900’s intelligence and supervisory circuits which constantly monitor the condition of both Normal and Emergency power sources thus providing the required intelligence for transfer operations. These circuits, for example, automatically initiate an immediate transfer of power when power fails or voltage levels drop outside a preset value. Exactly what the ATC-900 will initiate in response to a given system condition depends upon the combination of standard and selected optional features. The user may program several features and Input/Output functions. Optional features are: Closed Transition, Current Metering, and Ethernet. Refer to Section 1.4.2

When the preferred source is connected and the automatic transfer switch is operating normally, the status appears in the display window. In the event of a power failure, the display automatically becomes active, showing the status of timers relative to an alternate source transfer. Once the alternate source becomes available, the transfer is made consistent with pre-programmed features. In a similar manner, transfer back to the preferred source is made once the preferred source is again available. System conditions relative to the sources and the load are clearly indicated by the LED type mimic bus.

4.2.1 I/O Functions & Contact Ratings
As described in Section 2, the rear access area provides for access to all input connections. The output relay contacts are rated for 10 A, 1/3 HP @ 250 Vac. The DC rating is 10 A @ 24 Vdc. Each contact input (same for I/O Module) provides a wetted 24 Vdc at 10 mA. Refer to Figure 2 for a graphical representation and position of all input connections. There are two types of I/Os, programmable and fixed. Most I/O are programmable by the user at any time. There are a few that are fixed from the factory. These I/O are fixed as the functions they performed are critical or defined by factory installed hardware, and should not be reprogrammed by a user. For example, on switches equipped with service entrance, one of the programmable inputs would be permanently set to “Go to Neutral”.

NOTICE
CERTAIN INPUTS MAY NOT BE OPERATIONAL DEPENDING ON USER PURCHASED OPTIONS.

The ATC-900 provides for four in and four out programmable I/Os.

Source 1 Auxiliary Close
This input is located on pins 1 and 2 of connector J6 and factory wired to the Source 1 breaker (or contactor) auxiliary contact that is closed when the Source 1 breaker is closed.

S1 Available
This Form C relay is used to indicate the availability of Source 1. The full Form C contact of this relay is implemented with common pin 1, normally closed (NC) pin 3, and normally open (NO) pin 2 of connector J4. This relay essentially duplicates the Source 1 available status LED meaning that the setpoint criteria has been met. The relay contacts are rated for 10 A, 1/3 HP @ 250 Vac. The DC rating is 10 A @ 24 Vdc.

S2 Available
This Form C relay is used to indicate the availability of Source 2. The full Form C contact of this relay is implemented with common pin 4, normally closed pin 6, and normally open pin 5 of connector J4. This relay essentially duplicates the Source 2 available status LED meaning that the setpoint criteria has been met. The relay contacts are rated for 10 A, 1/3 HP @ 250 Vac. The DC rating is 10 A @ 24 Vdc.

Source 2 Auxiliary Close
This input is located on pins 3 and 4 of connector J6 and wired to the Source 2 breaker (or contactor) auxiliary contact that is closed when the Source 2 breaker is closed.

S1 Generator
This latched coil relay provides a Form C contact on pins 1(COM), 2(NO), 3(NC) of connector J15. The relay is the generator start relay for system configurations employing a generator on the input source designated Source 1. The generator start relay contacts are rated for 10 A, 1/3 HP @ 250 Vac. The DC rating is 10 A @ 24 Vdc with a 150 W maximum load.

S2 Generator
This latched coil relay provides a Form C contact on pins 4 (COM), 5(NO), 6(NC) of connector J15. The relay is the generator start relay for system configurations employing a generator on the input source designated Source 2. The generator start relay contacts are rated for 10 A, 1/3 HP @ 250 Vac. The DC rating is 10 A @ 24 Vdc with a 150 W maximum load.
Transfer Operation Connections Output Relays K1, K2, K3, K4
K1, K2, K3, and K4 on J6 pins 5 through 12 are factory wired to operate the transfer switch. The relay contacts for each are rated for 10 A, 1/3 HP @ 250 Vac. The DC rating is 10 A @ 24 Vdc. The K relay outputs are used to control the transfer device. Certain configurations of power use only the Open K relays. The K relays default configuration is:

K1 = S2 Open (Trip)
K2 = S1 Open (Trip)
K3 = S1 Close
K4 = S2 Close

The user should refer to the switch drawings for usage. The relays momentarily energize until the ATC-900 senses that the switching device has closed or opened (Using AUX-illary contacts) and then de-energizes the K relay to the normally open state.

4.2.2 Popular Inputs and Outputs (Programmable I/O)
The following are some popular I/Os that can be programmed. See the I/O Table 8 in Section 5.5 and Appendix B for all of the I/O Descriptions. A fixed input or output is one that is not user programmable as it is fixed from the factory. It is tied to a switch or function of a switch that requires that input or output. If more than one Programmable Input is set to the same input type, their behavior is dependent on what type of input they are set to. Some inputs are Normally Closed, like Lockout and Monitor Mode – NC, while the rest are Normally Open. For example, if multiple inputs are programmed for Lockout, opening any Lockout input will cause a Lockout condition, while all Lockout inputs must be closed to remove the Lockout condition. On the other hand, if multiple inputs are programmed for Go To Emergency, closing any Go to Emergency input will initiate a transfer to the Emergency Source, while all Go to Emergency inputs must be open to return to the Normal Source.

Similarly, two or more Programmable Outputs may be set to the same output type. This allows multiple output contacts to operate based on the same function.

Lockout (Input)
The Lockout contact is closed to enable normal, automatic operation. Opening this contact will inhibit all automatic operation. This feature is used when non-automatic control is required. The ATC-900 continues to monitor source status and will accurately display status on the controller’s mimic bus. After the controller has been locked, the user must reset the controller by simultaneously pressing the Help and Enter buttons.

Go To Emergency (Input)
When the Go to Emergency contact is closed, a transfer to the Emergency Source will be initiated. If the Emergency Source fails and the Normal Source is available, the ATC-900 will initiate a transfer back to the Normal Source (failsafe).

The Go To Emergency input is only usable when either Source 1 or Source 2 is preferred. This input will be disabled when the Preferred Source selection is set to None.

The Emergency Inhibit input takes priority over the Go To Emergency input if both are activated at the same time. In this case, the generator will start but a transfer to the Emergency Source will be inhibited until the Emergency Inhibit input is de-activated.

Bypass Timers (Input)
This momentary contact will bypass the timer for TDEN, TDNE, TDN, TDES, and TDEC. By pushing the Help and Enter buttons on the front of the controller (Bypass Timer) at the same time the countdown will be set to 0 for the current countdown. The next timer will then start. There is also a programmable input that will allow the bypass timer to be completed remotely if desired.

Go To Neutral (Input)
A maintained closed contact forces the controller to switch to the Neutral position, thereby disconnecting the load from both sources.

Manual Re-Transfer (Input)
With manual retransfer enabled, a momentary closure allows the ATC-900 to proceed with a re-transfer operation at the operators discretion. Should a failure of the emergency source occur while waiting for the manual return, the re-transfer proceeds automatically (failsafe).

Emergency Inhibit (Load Shed) (Input)
This input is enabled when the Emergency Inhibit (36) is enabled. The contact is closed for normal operation. Opening this contact will activate the Emergency Inhibit input.

If the Emergency Inhibit contact is opened when the load is connected to the Normal Source, no action will be taken if the Normal Source is available. If the Normal Source is not available, an immediate transfer to the Neutral position will occur.

If the Emergency Inhibit contact is opened when the load is connected to the Emergency Source, the ATC-900 will transfer the load to the Neutral Source if it is available. If the Normal Source is not available, an immediate transfer to the Neutral position will occur if the Emergency Source is available.

The Emergency Inhibit input is only active when either Source 1 or Source 2 is preferred. This input is ignored if the Preferred Source selection is set to None.

The Emergency Inhibit input takes priority over the Go To Emergency input if both inputs are activated at the same time. In this case, the generator will start but a transfer to the Emergency Source will be inhibited until the Emergency Inhibit input is de-activated. If the preferred source is lost during this time, the switch will transfer to the Neutral position.

Three Source ATS Control (Primary (output)/Secondary (Input))
The ATC-900 Primary/Secondary (old Master/Slave) controller functionality provides the user with the ability to control a three-source system consisting of a utility and two generator sources. In a three-source system, the Primary ATS controls the engine starting and stopping of the Secondary ATS. See Feature list, 90A and 90B for a full functionality write-up on page 37.

Note: The Secondary ATS requires the DCT module for a DC power input to keep the controller powered or a UPS if desired. The Primary ATS handles all transfer time delays between the Utility to Generator transfer. The primary is the Generator Start from the first ATS.

Bypass Safety Interlock Transfer Inhibited (Input Option 81P)
Whenever the contactor bypass has a safety interlock condition such as: a Door Open, a Contactor(s) not locked in, not in automatic, in Monitor Mode, etc, the automatic transfer functionality will be inhibited. This input will trigger a warning status that can be monitored via communications (Serial or Ethernet) and a flashing banner on the controller’s display. There is also a form C contact block that the user can also use, see the switch’s instruction booklet.

For more information visit: www.eaton.com
4.3 Switch Type Setpoints

There is a feature that the user can set the SWITCH TYPE (Device) by simply changing the setpoint. See Tables 4 and 5 below. This allows the ATC-900 controller to be completely programmable by the end user with all options available. It cannot be read/changed by MODBUS. The feature types are the following and depends on if the switch is an open type or a closed (and open) type. See section 5.2 on how to set the switch type.

4.4 Test Mode

The Engine Test is intended to allow periodic system tests. The exact test conditions are determined by the programmed setpoints. The operator-selected parameters include setting the engine run time and the Test Mode. Refer to Table 7 for test programming details.

There are four test modes:
- 1 No Load Engine Run Test;
- 2 Load Transfer Engine Test; or
- 3 External: Select No Load or Load Transfer based on Engine Test Mode Select programmable input.
- 4 Disabled.

If the ATS is unable to process a engine test request due to the ATS status, the request is ignored.

When the Engine Test pushbutton is pressed, the display will prompt the user to input a password (factory set to 0900). Use the arrow keys to enter the password, then press the right arrow key to highlight the “Enter Password” icon and press the Enter key.

The ATC-900 will display the Time Delay on Engine Starting (TDES) timer countdown. Once the TDES countdown reaches zero, the ATC-900 Controller will initiate an engine start. The engine run duration will be per the Engine Run Test Time setpoint.

If Test Mode is set to “Engine Run”, then the switch will start the non-preferred generator, but will not initiate a transfer to the non-preferred source.

If Test Mode is set to “Load Transfer”, then the switch will start the non-preferred generator and initiate a transfer to the non-preferred source once the generator output has reached the specified setpoints.

All enabled and programmed time delays will be performed per the setpoints during an engine test. The time delays will appear on the LCD display with “countdown to zero” when active. Depending on the setpoints and the optional features selected with the ATC-900 Controller, these can include:

- Time Delay Engine Start (TDES);
- Time Delay Normal to Emergency (TDNE);
- Time Delay Emergency to Normal (TDEN);
- Time Delay for Engine Cool-down (TDEC);
- Time Delay Neutral (TDN);
- Time Delay Normal Disconnect (TDND)*
- Time Delay Normal Reconnect (TDNR)*
- Time Delay Emergency Disconnect (TDED)*
- Time Delay Emergency Reconnect (TDER)*
- Pre-transfer Delay Signal (TD PRE-TRAN).
- Post-transfer Delay Signal (TD POST-TRAN).

* See flowchart example in Appendix C.

All operations are “Failsafe”, meaning they prevent disconnection from the only available power source and also force a transfer or re-transfer operation to the only available power source.

During an engine test, if the Engine Test pushbutton is pressed a second time before the Engine Test is complete, the Engine Test will be terminated. An engine test may also be aborted in the following ways:

1. If the Emergency Source does not become available within 90 seconds of the ATC-900 providing the engine start command;
2. If, during the TDNE countdown, the Emergency Source goes unavailable more than three times (Each time, TDNE will restart);
3. If the Emergency Source is powering the load and it goes unavailable for more than the TDEF (Time Delay Engine Failure) setting; and
4. If the Normal source becomes unavailable.

When an engine test is aborted due to an unavailable source during TDNE countdown, the Alarm relay will energize, a “TEST ABORTED” message will appear on the display, and the event will be logged into the Transfer History as “Aborted Test” Aborted.

4.5 USB Interface (Event Status-Setpoints)

Every ATC-900 transfer switch includes a front panel, NEMA 4X rated USB port for use in configuring set points or downloading event data to a USB flash drive. The USB interface is brought to the front of the enclosure to enable flash memory (memory stick) to be plugged in to upload or download data such as History Data Logging, or Setpoints. The USB interface will only work with memory devices and not laptop computers.

4.5.1 Upload/Download Setpoints via USB

To reduce the time spent on site for commissioning, set points can be configured at a PC using the ATC-900 configuration software and saved to a USB flash drive to be uploaded to one or multiple controllers. Set points are also easily copied from one controller to another. See EASE, section 7.1, last paragraph.
4.5.2 Downloading Statistics and Event logs via USB

Downloading statistics and event capture data provides the user the ability to more thoroughly analyze high speed capture data using a PC, or data can be emailed to Eaton’s Technical Support Team when off site troubleshooting support is required. Section 7.1 shows the instructions for downloading event capture data.

4.6 Communications

ATC-900 is a Monitoring Protection and Control Communications compatible device. As such, it can be remotely monitored, controlled, and programmed. The ATC-900 is equipped with a Modbus RTU (RS-485 physical layer) communications port as standard. This permits it to have the communications option supplied from the factory. A COTS (Commercial Off The Shelf) Ethernet to Modbus can also be used. There are several options to increase security of the Modbus port.

- The Modbus port can be completely deactivated by setting the Modbus Configuration setpoint to "disabled".
- Writes to statistical resets, control functionality, and setpoint configuration can be restricted by setting the Modbus Writes setpoint to "disabled". Note that setting the date/time via Modbus is not affected by the Modbus Writes setting.
- Setting the date/time through Modbus can be restricted by setting the Time Sync setpoint to any option except "via Modbus".

4.6.1 Power Distribution Software

The ATC-900 is also compatible with Eaton’s Power Xpert Gateway for web-based monitoring, via Modbus TCP/IP, SNMP, or BACnet/IP Protocols. The Power Xpert Gateway can be used to consolidate data from many devices, including communications ready transfer switch controllers, trip units, and meters, as well as other Eaton devices. Certain Versions of the Power Xpert Gateway include email event notification and data-logging functionality. Additional features include:

- System/device alarm logging and reporting;
- Time/event historical data logging;
- Data trending;
- Information storage/retrieval by device event;
- Hardware diagnostics;
- Dedicated computer not required;
- Security password protection; and
- Gateway interface for connectivity to other information networks.

Section 5: Setpoint Programming and I/O Programming Using the Color Display

5.1 Introduction

The ATC-900 is fully programmable from the device’s faceplate or through the communications port. Users can reprogram setpoints as well as other parameters. Up to four optional I/O modules, each having four in and four out programmable I/Os can be used with the ATC-900. That is a total of 20 Input and Outputs that can be user programmed. Some inputs will require controller setpoints to be set to a certain configuration. See Section 5.6 for some rules and more information.

5.2 ATC-900 Set Switch type (Style) Functionality

Switches from the factory using the ATC-900 will be programmed according to the switch type, ie. contactor, breaker, etc. This feature, using individual controllers (not in a switch,) allows the setting of the Style/switch Type through the front panel or the USB Load Setpoint function within certain parameters:

- From the front panel the Switch Type can be changed to any type, including unprogrammed, but the open/closed transition style cannot be changed.
- From the USB port the Switch Type change has the same restriction of not changing open/closed transition style, but has the added restriction that the controller must be set to the “Unprogrammed” type prior to loading setpoints with the new Switch Type. This protects against accidentally loading a setpoint file with an incorrect switch type to a controller that is already programmed.
- Table 6 shows all possible Styles at this time, including the new “Unprogrammed” types.

Table 6. ATC-900 Style/switch Type Selections

</table>

The style 0 or style 1 is the default on initial power-up of a controller not in a switch.

When the Style/switch Type is Unprogrammed the controller goes into Monitor Mode. To inform the user of this the main screen displays a warning as shown in Figure 7d. All buttons will work normally but the user will not be able to view the main screen’s source and load voltages until a Switch Style is configured. It is possible that the top banner will display a higher-priority message, such as Lockout. (See Section 5.2.1 to program using Password 0900).
5.2.1 Entering and Exiting the Program Mode

Using the left/right arrow keys, navigate to the desired screen icon and press the Enter key. The "Change Setpoints" screen will require a password to access (factory default is 0900).

Press the Up arrow key to select the first programmable option. The up and down arrow keys will navigate through the list. The color display is not a touch screen, so all changes will require the use of the arrow keys and the enter key.

A. Load Metering

The Load Metering screen presents (Figure 8) the different measurements of the Load. Note that the DCT module is required to display Load current, Watts, VAR, VA, and power factor. Otherwise only voltage measurements will be shown. See Section 2 for the DCT Module specifications.

B. View Setpoints

This will allow the user to view the:

- System Setups:
- Time Delays;
- Dropouts / Pickups;
- Engine Test / PE; and
- Programmable I/O.

C. Change Setpoints

The programmable features are grouped in a logical flow for ease of programming or users can skip to a specific group for quick adjustments.

This will allow the user to set all available setpoints shown in the "View Setpoints" screens. Setpoint examples will follow in Section 5.4 and Programmable I/O examples will follow in Section 5.5. A password is required to change setpoints. The password can be changed from the factory default of 0900 by selecting "Change Setpoints", navigating to the "Change Password" option, and pressing the Enter key. You will be prompted to enter the old and new passwords. When finished, navigate to the "Save" icon and press the Enter key.

D. Historical Data

See Section 7 for Historical and Event displays.

E. System Info

System Information is an area where the switch configuration, GO, Serial, and version numbers can be viewed. It also provides manual time/date setting if none of the Time Sync options are used.

F. USB Menu

See Section 4.5 for USB operation.
5.3 User Programming
One may view setpoints or change setpoints through the menu with the display. Remembering that the display is not a touch-screen, the arrow push buttons are used to maneuver the screen. Once a new setpoint selection has been made, move to the next feature in need of a change. Once all setpoints on that particular screen have been made, one must remember to select Save on the bottom right row of the menu items and the new setpoints will be stored. The full list of menus can be seen in section 3.4.1

5.4 Programmable Features/Setpoints

NOTICE
CHANGING THE SYSTEM NOMINAL VOLTAGE OR FREQUENCY SETPOINTS WILL AUTOMATICALLY CHANGE ALL THE PICKUP AND DROPOUT SETTINGS TO NEW DEFAULT VALUES.

All ATC-900 programmable features and associated setpoint possibilities with any required explanations are presented in Table 7. As mentioned earlier, when "Change Setpoints" is selected, the display will show the following icons:
• System Setups: default screen, 4 total;
• Time Delays
• Dropouts / Pickups
• Engine Test / PE
• Programmable I/O

The System Setpoints screen contains normal voltage/frequency, preferred source, CT Ratio, communications, closed or open, and several more. After the initial setting of these system setpoints, they usually will not be changed.

The following example explains how to change a time delay.

Figure 10. Setting Time Delay.

Once the "Change Setpoints" is pressed, and the password is entered, four areas of setpoints show up on the bottom of the screen. Using the arrow keys, navigate to the "Time Delay" Icon and hit “Enter”. Use the up/down arrow buttons to select a desired setpoint and press the Enter key.(see Figure 10). The selected setpoint should change from blue to red indicating that it is ready to edit. With the up/down arrow buttons, change the value and press Enter again after the desired value is reached. When all changes are completed on that page, use the arrows to select “Save” and then press “Enter” as shown on Figure 11.

NOTICE
IF NO PUSHERBUTTON ACTIVITY IS DETECTED FOR APPROXIMATELY 2 MINUTES WHILE IN THE PROGRAM MODE, THE DISPLAY WILL REVERT BACK TO THE MAIN MENU. ANY UNSAVED CHANGES WILL BE LOST.
Figure 11. Setting Setpoints.

All setpoints, are set in this way. The display gives the user a quick look at not just one setpoint but the whole category on one screen. The user can easily go back and forth as needed to establish the correct settings for the system.
Table 7. Programmable Features/Setpoints.

**Any TDES value above two minutes, with no power on the controller, will start the generator (fail-safe) after two minutes.**

---

For more information visit: [www.eaton.com](http://www.eaton.com)
5.5 Programming I/Os

The ATC-900 has four inputs and four outputs that are programmable I/Os. The outputs are Form C types and easily assessable. Depending on the switch types, the I/Os are wired out to the terminal blocks that are easily assessable. If they are not wired out to terminal blocks, the controller will contain the necessary plugs to tap into easily. The terminal blocks also have engine start (Gen Start) and S1/S2 availability wired. If more I/Os are required, the use of an I/O module is required as shown in Section 2.5.2. Up to four I/O modules can be used which will give 20 programmable I/O. In most cases, the controller itself or the controller with one I/O module should be enough. The I/O module can also be added on in the field if the application calls out for more I/Os. The following are the programmable Inputs and Outputs of the controller. See Appendix B for a description of the available I/Os.

Programmable Inputs
- Remote Engine Test
- Bypass Timers
- Preferred Source Selector
- Go to Emergency (S2)
- ATS on Bypass
- Manual Retransfer
- Enable Manual Retransfer
- Load Shed - S2 Inhibit
- Go to Neutral Position (not SE Rated)
- Lockout
- Monitor Mode (NC or NO)
- Secondary Input
- Disable (Default settings)
- Bypass Safety Interlock Transfer Inhibited Fault Alarm
- Closed Transition Inhibit
- Engine Test Mode Select

Programmable Outputs (Form C)
- Normal (S1) Source Available
- Emergency (S2) Source Available
- Normal (S1) Source Position
- Emergency (S2) Source Position
- Pretransfer Signal Contacts 1
- Post Transfer Signal Contacts 1
- Pre/Post Transfer Signal
- Load Sequencing Contacts (1)
- Load Sequencing Contacts (2)
- Load Sequencing Contacts (3)
- Load Sequencing Contacts (4)
- Load Sequencing Contacts (5)
- Load Sequencing Contacts (6)
- Load Sequencing Contacts (7)
- Load Sequencing Contacts (8)
- Load Sequencing Contacts (9)
- Load Sequencing Contacts (10)
- Selective Load Shed
- General Alarm Indication Contact
- Monitor Mode
- ATS in Test
- Engine Test Aborted
- Cooldown in Process
- Engine Start Contact Status (Gen 1 & 2)
- LOAD SHED - Emergency Inhibit On
- ATS on Bypass
- Load Bank Control
- Remote I/O (Controllable by Modbus)
- Health
- Disable (Default Settings)
- Waiting for Sync

* See descriptions of each I/O in Appendix B

Note: S2 Permit (Input), S2 Request (Output), and TDNF (Timer) are used on a private switch, please see switch instruction booklet for information

Outputs (Alarms & Warnings)

Appendix A: Feature Timer List and Status Display Messages in the status area at the end of the manual describes the Yellow and Red banners on the ATC-900. Any flashing red banners will energize the programmable output general alarm indication contact.

Each I/O module uses a CAT V straight cable or better, and are strung together to the ATC-900’s J11 connector.

Table 8 shows most of the ATC-900’s features and the programmability of each. There are five categories:
- **P** Programmable
- **PF** Programmable Fixed I/O
- **O** Optional
- **OF** Optional Fixed
- **S** Standard

In some applications, a certain I/O will be fixed (PF) from the factory and the user will not be able to change the location of the I/O. An example of this is for Service Entrance. Service Entrance requires the “Go to Neutral” (option 37) input. This is a function of the switch so the user will not be able to change which input “Go to Neutral” is set to on the ATC-900.

For the Optional Fixed, an example would be for a Preferred Source Selector (10C), which is an external two position switch that allows the user to select the preferred source. Anything with an external switch on the door will require that particular I/O to be fixed. When any of the I/O is fixed, the color will be black (instead of Blue) and it will also show up in the System Info Menu screen. There are some options that will require an I/O module due to a large number of fixed I/O required. There could be several I/Os that are associated with an option i.e. Load Sequencing Contacts. Some programmed input examples are shown below. These can be easily change by the user.

| #1 Input | Lockout | 81J |
| #2 Input | Go to Neutral (Isolated) | 37 |
| #3 Input | S2 Inhibit (Load Shed) | 36 |
| #4 Input | Go to S2 | 26D |
The I/O’s are programmed similar to the setpoint programming. The user may view the I/O’s programmed by going into the View Setpoints area or one can program the I/O, including the I/O Module by going into the Change Setpoints Menu. Figure 12 shows the Programmable Inputs screen. Figure 13 shows the Programmable Outputs screen. Programming an I/O module is done in the same manner. Figure 14 shows the Module’s final programming. Be sure to press the enter key when you have completed each input (or output). “Save” your choices for each Module before changing screens, or your settings will be lost.

When the I/O is “Fixed” the display will show the particular I/O in the designated slot. The display will show a fixed I/O as black instead of blue.

Table 8 shows the features and the I/O of the controller. There are several more switch features and options not shown in Table 8. See Appendix B for more information and definitions. This IB is updated during the year but some features may not be shown because of the time element of the IB getting published. Eaton is constantly adding in more features to the ATC-900. As mentioned, the user will receive all software features except for the optional closed transition. The “P” and “S” (programmable, standard) included in all ATC-900’s. The difference is that the “P” refers to the I/O programming. If the switch requires more I/O than 4 in or 4 out, an I/O Module will be required. The right column shows the I/O required for that particular option.

The fixed I/O is required when a switch on the door may be used to enable an option. An example would be a two position switch on the front of the door to enable Load Shed.

5.6 Programming Setpoints for Inputs (Rules)
There are some rules to follow when particular Inputs are programmed.

1. In the setpoints, Time Delay Neutral (TDN) must be set to "n/a" when using "Load Decay." Conversely, "Load Decay" must be set to "n/a" if "TDN" is being used.

2. The voltage unbalance protection can be disabled by the user simply by setting them to "0".

3. With the Input of the controller programmed to the following inputs, associated setpoints will also be required to be appropriately set.

**INPUT** | **SETPOINT(S)**
---|---
Manual Retransfer | Manual Retransfer, Preferred Source
Enable Manual Retransfer | Manual Retransfer
Preferred Source Selector | Preferred Source
Emergency Inhibit | Preferred Source
Go to Emergency | Preferred Source
Secondary | Operating Mode, # of Generators, Preferred Source
Engine Test Mode Select | Engine/PE Test Mode
Section 6: Troubleshooting and Maintenance

6.1 Level of Repair

This manual is written with the assumption that only transfer switch system troubleshooting will be performed. If the cause of malfunction is traced to an ATC-900, the malfunctioning unit should be returned to Eaton for a replacement.

For ATS assistance, call Eaton Care at: 877-386-2273

ATC-900 Generic Part Numbers:
ATC-900 Eaton Open Transition 8160A90G01
ATC-900 Eaton Closed Transition 8160A90G64
DCT Module part number 70C177G01
I/O module part number 70C1776G01

NOTICE

DURING CONVERSATIONS WITH EATON CONCERNING TROUBLESHOOTING OR PRODUCT RETURN, THE CUSTOMER MAY BE ASKED FOR INFORMATION PERTAINING TO THE SOFTWARE VERSION AND OPTIONS INCLUDED IN THE SPECIFIC UNIT. THE SYSTEM INFO SCREEN HAS THE DATA REQUIRED FOR THE CONTROLLER. IF THE CONTROLLER IS NOT FUNCTIONAL USE THE LABEL ON THE BACK OF THE UNIT.

Table 9. Troubleshooting Guide.

<table>
<thead>
<tr>
<th>SYMPTOM</th>
<th>PROBABLE CAUSE</th>
<th>POSSIBLE SOLUTION(S)</th>
</tr>
</thead>
<tbody>
<tr>
<td>All front panel indicator LED’s are off.</td>
<td>Control power is deficient or absent. ATC-900 is malfunctioning.</td>
<td>Verify that control power is connected at J7 and that it is within specifications. Replace the unit.</td>
</tr>
<tr>
<td>Automatic LED is not blinking.</td>
<td>Control power is deficient or absent. Stuck waiting for Neutral position ATC-900 is malfunctioning</td>
<td>Verify that control power is connected at J7 and that it is within specifications. Mechanical problem; No input from limit switch. Replace the unit.</td>
</tr>
<tr>
<td>One or more voltage phases read incorrectly.</td>
<td>Incorrect wiring. ATC-900 is malfunctioning.</td>
<td>Verify voltage with multimeter. Check wiring. Replace the unit.</td>
</tr>
<tr>
<td>Front panel pushbuttons do not work.</td>
<td>Bad connection inside ATC-900.</td>
<td>Replace the unit.</td>
</tr>
<tr>
<td>Unit did not accept new setpoints via front panel.</td>
<td>Operator error. Make sure “Enter” is pressed when completed. No pushbuttons pressed for 2.5 minutes.</td>
<td>See Section 5 for rules on programming setpoints. Avoid intervals of 2.5 minutes of inactivity with pushbuttons when changing setpoints.</td>
</tr>
<tr>
<td>Voltage dropout and pickup setpoints are different than what was programmed.</td>
<td>Adjusted nominal voltage setpoint.</td>
<td>Re-adjust all dropout and pickup setpoints to default values.</td>
</tr>
<tr>
<td>Frequency dropout and pickup setpoints are different than what was programmed.</td>
<td>Adjusted nominal frequency setpoints.</td>
<td>Re-adjust all dropout and pickup setpoints to default values.</td>

<td>Engine fails to start after TDES times out.</td>
<td>S1 or S2 Generator start relay contacts not closed. ATC-900 is malfunctioning.</td>
<td>Verify contact closure at desired control input on J4. Replace the unit.</td>
</tr>
<tr>
<td>Engine starts at 2 minutes with TDES set over 2 Minutes.</td>
<td>Incorrect wiring at generator.</td>
<td>Replace the unit. Check engine wiring/maintenance.</td>
</tr>
<tr>
<td>Engine fails to turn off after TDEC times out.</td>
<td>S1 or S2 Generator start relay contacts not open. Incorrect wiring at generator. Connected LED not lit for either source.</td>
<td>Replace the unit. Check engine wiring. Verify contact closure at desired control input on J4. Replace the unit.</td>
</tr>
<tr>
<td>Unit will not perform an Engine Test.</td>
<td>Incorrect password after Test button was pushed. Engine Test setpoint is set to Disabled. Number of Generators setpoint is set to 0.</td>
<td>Re-enter correct password. The factory password is 0900. Re-program Engine Test setpoint. Re-program Number of Generators setpoint.</td>
</tr>
<tr>
<td>Switch does not perform correctly</td>
<td>Assure correct Switch Type is programmed in the ATC-900 controller.</td>
<td>In the System menu screen 4 of 4, program the correct user switch. See section 4.3</td>
</tr>
</tbody>
</table>

For more information visit: www.eaton.com

6.2 ATC-900 Device Troubleshooting

The Troubleshooting Guide (Table 9) is intended for service personnel to identify whether a problem being observed is external or internal to the unit. For assistance with this determination, contact Eaton. If a problem is identified to be external to ATC-900, proceed to Section 6.3 and continue troubleshooting.

In a mission critical application, failure to transfer to the back-up power power system requires quick and decisive action. The ATC-900 provides users with data to help quickly identify the root cause of the issue and minimize system downtime. Historical Data, Event Details, and Hi-Speed Capture allows one to diagnose the problem quickly and accurately. Please refer to Section 7 (Historical and Event Display) for displaying the information. The information can also be downloaded using a memory stick (USB port) and put on a Windows PC for viewing in Microsoft Excel.

If a red fault message is flashing on top of the display and the cause of the fault is resolved, simply press “Help” and then “Enter” and the message will be removed.

Power Isolation Requirements: Control power for Source 1, J7-1,2 must be electrically isolated from control power for Source 2, J7-3,4. Similar for accessory I/O Module on J1-1,2 and J1-3,4 for S1 and S2 respectively.

Effective: March 2021

WARNING

ONLY PROPERLY TRAINED PERSONNEL FAMILIAR WITH THE TRANSFER SWITCH EQUIPMENT AND ITS ASSOCIATED EQUIPMENT SHOULD BE PERMITTED TO PERFORM THE PROBLEM SOLVING FUNCTION. SPECIFICALLY, ONLY PERSONS CLASSIFIED AS QUALIFIED UNDER FAILURE, TO UTILIZE QUALIFIED PERSONNEL (UNDER NFPA 70E) SHOULD WORK ON EQUIPMENT. IF NOT, IT COULD RESULT IN PERSONNEL INJURY AND/OR DEATH.

DANGER

HAZARDOUS VOLTAGES IN AND AROUND TRANSFER SWITCH EQUIPMENT DURING THE PROBLEM SOLVING PROCESS CAN CAUSE PERSONAL INJURY AND/OR DEATH. AVOID CONTACT WITH ANY VOLTAGE SOURCE WHILE PROBLEM SOLVING. USE LOCK-OUT TECHNIQUES TO ASSURE POWER IS REMOVED.

This section explains basic troubleshooting for Transfer Switches. The particular switch instruction booklet should be used to troubleshoot. A basic problem solving effort is the first step to take prior to calling for assistance. Frequently, the effort will successfully address most problems encountered. The problem solving procedure is presented in the following sections as observed Problem Symptoms and one or more possible Solution Steps. All of the steps presented may not apply to all transfer switches, depending upon the logic. Remember, only qualified individuals familiar with the transfer switch equipment and the system in which it is applied should attempt these problem solving procedures.

If a problem persists after having completed the problem solving procedure, contact an Eaton representative for further assistance. When calling for assistance, the following is the minimum information required to properly address the need:

Note: If a message is flashing on top of the display and the fault is removed, simply press “Help” and then “Enter” and the message will be removed.

1. General Order Number (GO#) of transfer switch, plus related Item Number;
2. Catalog Number of transfer switch;
3. Actual location of transfer switch (type of facility, address, etc.);
4. Style number of the controller;
5. Company, name and position of individual representing company;
6. Basic description of situation as it exists; and
7. Any results of problem solving steps taken and/or readings taken from the events and summaries.

Effective: March 2021
6.3.1 Transfer Switch Appears Inoperative

Step 1: Verify that all plugs and sockets are properly interconnected.

Step 2: If the source available LED is not on or the display shows the wrong voltage, make sure the controller setpoints match the system voltage. Verify that the correct system voltage is at the switch.

Step 3: Verify that the voltage selection plug on the transformer is in the proper position to match the system voltage.

Step 4: Look for any obviously burned components. Determine the cause and rectify, if possible. Replace defective components after the cause is determined.

Step 5: Is switch closed on source 1? Verify whether or not the system voltage now appears on the load terminals.

   If YES: Proceed to check logic for problems in respective logic instruction book.

   If NO: Check all power connections and the switching mechanism. What does the controller show for voltages on the main screen?

6.3.2 Transfer Switch Will Not Automatically Transfer to Normal

Step 1: Is Option 29G installed? If so, there is a switch on the door Labeled Auto Manual with either push buttons for S1 close, Trip, S2 Close or a three position switch with the same. The Auto Manual selector-switch must be in Auto for it to run with the controller.

Step 2: Is Option 9B installed? If so, there is a selector switch labeled “Maintenance”(or “Monitor Mode” for contactor-based switches.

   If YES: Verify selector switch is in the “Operate” position.

   If NO: Proceed to Step 3.

Step 3: Are the correct line voltage and frequency available at terminals N1, N2, and N3? Record the readings.

   If YES: Proceed to Step 4.

   If NO: Check Preferred source.

Step 4: Is the transformer voltage selector plug in the correct position?

   If YES: Proceed to Step 5.

   If NO: Position plug correctly.

Step 5: Check the voltage on transformer NT1 by measuring voltage between voting relay KV-1 and GND. Is the voltage measured 120 Vac (+/- 10 volts)? Record the reading.

   If YES: Proceed to Step 6.

   If NO: Check voltage transformer NT1.

Note: For contactor Bypass type switches, the doors need to be closed and latched for Normal Operation

6.3.3 Transfer Switch Will Not Automatically Transfer To the Non-Preferred Source

Step 1: If the alternate source is a generator, is it running?

   If YES: Proceed to Step 2.

   If NO: Check the generator. Check the engine start contacts.

Step 2: Is the correct line voltage and frequency available at the Non-preferred source terminals? Record the readings.

   If YES: Proceed to Step 3.

   If NO: Verify that there is output voltage from the generator.

Step 3: Is the voltage selector plug in the correct position?

   If YES: Proceed to Step 4.

   If NO: Position plug correctly.

Step 4: Is the Preferred source available?

   If YES: Proceed to Step 5.

   If NO: Proceed to Step 6.

Step 5: Is a test Engine Test or Plant Exerciser being run, or is the “Go to Emergency” input energized?

   If YES: Proceed to step 6.

   If NO: STOP! The transfer switch should not transfer to the Non-preferred source if the preferred source is available and connected.
Step 6: Make sure that the setpoints are set according to the system voltage.
   If YES: Proceed to Step 7.
   If NO: Adjust system voltage setpoints to match system voltage and phase.

Step 7: Is the Non-preferred switching device charged?
   If YES: Proceed to Step 8.
   If NO: Consult Magnum Breaker troubleshooting manual on how to charge the breaker before proceeding.

Step 8: Is the Preferred switching device OPEN?
   If YES: Proceed to Step 10.
   If NO: Proceed to Step 9.

Step 9: If this is a Magnum, measure the voltage between terminals B10 and B11 on the Preferred switching device (shunt trip). Is the voltage measured 120 Vac (+/- 10 volts)? Record the reading.
   If YES: Refer to the Magnum Breaker maintenance manual IB#2C12060 and check the shunt trip Preferred switch.
   If NO: Check the wiring to B10 and B11.

Step 10: If this is a Magnum measure the voltage between terminals B12 and B13 on the Non-preferred switching device (spring release coil). Is the voltage measured 120 Vac (+/- 10 volts)? Record the reading.
   If YES: Refer to the Magnum Breaker maintenance manual IB#2C12060 and check the spring release coil Non-preferred switching device.
   If NO: Check the wiring to B12 and B13.

Step 11: If a problem persists, contact Eaton.

6.4 Replacement
Follow these steps to replace the ATC-900.

Step 1: Turn off control power at the main disconnect or isolation switch of the control power supply and lock it out to guard against other personnel accidentally turning it on.

Step 2: Verify that all “foreign” power sources wired to the ATS Switch are de-energized. These may also be present on some of the terminal blocks.

Step 3: Before disconnecting any wires from the unit, make sure they are individually identified to ensure reconnection can be correctly performed. Taking a picture may help with re-connections.

Step 4: Disconnect all plugs and connectors going to the ATC-900.

CAUTION
SUPPORT THE ATC-900 FROM THE FRONT SIDE WHEN THE SCREWS ARE LOOSENED OR REMOVED IN STEP 5. WITHOUT SUCH SUPPORT, THE UNIT COULD FALL AND THE PANEL COULD BE DAMAGED.

Step 5: Remove the 6 mounting screws holding the unit against the door or panel. These are accessed from the rear of the unit.

Step 6: Set the screws aside for later use.

Step 7: Mount the replacement unit.

Step 8: Secure the ATC-900 to the panel with the 6 mounting screws.

Step 9: Re-connect all plugs and connectors to their proper socket on the ATC-900. Make certain that each plug is securely seated.

Step 10: Clear out all personnel, close all ATS panels, remove any lockouts, and restore control power. Ensure all setpoints are correct.

6.5 Maintenance and Care
The ATC-900 is designed to be a self contained and maintenance free unit. The printed circuit boards are calibrated and conformally coated at the factory. They are to be serviced by factory trained personnel only. The front panel including the display can be cleaned lightly with a soap and water mixture.

6.6 Firmware Upgrade
If a firmware upgrade is recommended, Eaton tech support will provide you with a file download link. To upgrade the firmware, please consult the instructions provided by Eaton tech support or included with your firmware upgrade kit. After the USB thumb-drive is inserted, the last item on the menu will turn blue. Select the firmware file to update. Read the menus. It will take about 3 minutes to update.

* Ensure that power will not be removed during this upgrade.

Note: The firmware upgrade is not the same as uploading or downloading setpoints or downloading event information. See Section 7.1 for instructions on extracting setpoint and event information.
Section 7: Historical & Event Display

The ATC-900 event and data logging history can be read on the ATC-900’s display or downloaded to a USB thumb drive. Every ATC-900 transfer switch includes a front panel mounted NEMA 4X rated USB port for use in uploading downloading setpoints and event data. Downloading event data provides the ability to more thoroughly analyze information using a PC. It also allows data to be quickly e-mailed when off site troubleshooting support is required.

The information is time-stamped and has detailed resolution. An example of a usage of this timing is with the 10 second rule for critical applications. One could see the events and timing from when power was removed to when the switch transferred including engine start and source available.

Historical Data

The Historical Data display indicates historical and cumulative counter values as follows:

- Source 1 Available
- Source 1 Connected
- Source 1 Engine Run
- Source 2 Available
- Source 2 Connected
- Source 2 Engine Run
- Tier 4 Timer
- Load Energized
- Number of Transfers

Historical counter resets are date and time stamped events that are captured in the event log.

Event Summary

The ATC-900 controller stores a maximum of 500 time-stamped events.

Events include:
1. Actions of the transfer sequence
2. Alarms
3. Changes to the setpoints
4. Changes to the time/date
5. Resetting a historical counter
6. Engine Run test
7. I/O State changes

For event details, the time-stamping resolution is 0.01 seconds.

Events Details

Each transfer event can be expanded to view a step-by-step, time stamped, sequence of operation. All metered values are also logged and can be viewed on the Event Data Screen.
Hi-Speed Capture

The ATC-900 stores 4 seconds of metered data every 20 milliseconds or 0.02 seconds for certain events. The data is captured 2 seconds before and 2 seconds after the event. If the event is a power failure, then the capture is 4 seconds before the power failure.

Oscillographic data for 10 events is stored in the controller and may be downloaded over USB or displayed graphically on the TFT display. Events include:

1. Source unavailability actions that initiate a transfer sequence (undervoltage, overvoltage, etc.)
2. Successful transfers (at the point of breaker/contactor closure.)
3. Unsuccessful transfers (at the point of breaker/contactor failure to close or open.)

7.1 USB Operation

Insert a compatible USB flash drive into the USB port on the front panel. The ATC-900 will not accept a laptop directly hooked up to it, only a flash thumb drive (memory stick). When the USB flash drive is recognized, the USB menu icon will turn from gray to blue. Use the arrow keys to navigate to the USB icon and press Enter.

Note: If the USB drive has not been connected to an ATC-900 controller before, it will automatically create the required folder structure.

From here you can select from the following options: Main Menu, Save Setpoints, Load Setpoints, Save Statistics, Save Events, and Save Hi-Speed.

Main Menu – returns you to the Main Menu.

Save Setpoints – save current controller setpoints onto the USB flash drive.

Load Setpoints/Firmware – load setpoints or firmware from files on the USB flash drive (USB to Controller).

Save Statistics – saves all statistical controller data to the USB flash drive.

Save Events – saves all event data to the USB flash drive.

Save Hi-Speed – saves all high speed capture data to the USB flash drive.

To save current controller setpoints, use the arrow keys to navigate to the “Save Setpoints” icon and press Enter. The screen will display “Saving DSP Setpoints.” Once it has finished, it will display “Saved Setpoints to File: STPmmddyy-##.CSV”, where mmddyy is the current date, and ## is the numerical id (e.g. 1, 2, 3, etc.) If there is not enough free space on the drive, the screen will display “Insufficient Memory”.

To load controller setpoints from a setpoint file on your USB flash drive, use the arrow keys to navigate to the “Load Setpoints” icon and press Enter. The “Load Setpoints” feature will require a password to access (factory default is 0900). Once the password is entered correctly the screen will display a list of all setpoint files on the USB flash drive. Use the up/down arrow keys to highlight the desired setpoint file and press Enter. The controller will save a backup of the current setpoints to “STPmmddyy-BAK-##.CSV” and display a message confirming that setpoints were successfully loaded from the file.

To save controller statistics (e.g. connected time, available time, engine run time, etc.), use arrow keys to navigate to the “Save Statistics” icon and press Enter. The screen will display “Saving ATC-900 Statistics while the file is being created. Upon completion, the display will show “Saved ATC-900 Statistics to File: HSTMmddyy-##.CSV”.

To save controller events (e.g. transfer events, power up events, setpoint changes, etc.), use arrow keys to navigate to the “Save Events” icon and press Enter. The screen will display a percentage progress bar while event data is saved to the USB drive. When it is complete, it will display “Saved Events to File: EVTmmddyy-##.CSV”.

To save high-speed capture data (i.e. time-stamped voltage and current data), use arrow keys to navigate to the “Save Hi-Speed” icon and press Enter. The screen will display “Saving High Speed Captures” along with a progress bar. Once complete, it will display “High Speed Capture Files Saved”.

To access any of your saved files, simply remove the USB flash drive and connect it to a USB port on your PC. Browse to your USB drive and locate the “ATC-900” folder. Inside that folder should be three sub-folders: Firmware, History and Setpoint. All setpoint saves and backups will be in the “Setpoint” folder. Firmware Upgrade files must be in the Firmware folder. All Statistics, Events, and High-Speed capture files will be in the “History” folder. All files except firmware upgrades are viewable using a CSV file viewer such as Microsoft Excel, Notepad, or OpenOffice Calc.

A user friendly setpoint program is available free of charge on line at: www.eaton.com. Download “Eaton ATC-900 Setpoint Editor” (EASE). This can be loaded on any personnel computer and will allow for the user to view the current setpoints and also change the setpoints. Once the setpoints have been saved to the USB thumb drive, that drive can be used to set several switches to the same settings.
Appendix A: Feature Timer List and Status Display Messages

Feature: Time Delay Normal to Emergency (TD Normal to Emer-
gency)  
TDNE delays the transfer to the Non-preferred Source to permit stabilization of the Non-preferred power source before the transfer is made. This timer will begin the countdown from its setting value when the Non-preferred Source becomes available. If the Preferred Source should become available during the countdown of this timer, the timer will be aborted. Also see feature Commit to Transfer During TDNE Timing.

Feature: Time Delay Engine Start (TD Engine Start)  
TDES is used where the source is an engine generator. It delays initiation of the engine start circuit in order to override momentary power outages and/or fluctuations. This timer and the associated engine start circuit will operate with or without control power. There are two separate start circuits, one for each source when applications of two generators are selected. Time Delay Engine Start (TDES) timer values individually programmable for each. When one generator is selected, this timer's engine start circuit will operate on generator 2 for source 2. If the source that is being transferred to has a generator and that source is already available, the TDES timer will be bypassed.

Feature: Time Delay Emergency to Normal (TD Emergency to Nor-
mal)  
TDEN delays the transfer to the Preferred Source to permit stabilization of the Preferred power source before the transfer is made. This timer will begin the countdown from its setting value when the Preferred Source becomes available. During the countdown of this timer, if the Preferred Source should become unavailable, the timer will be aborted. If the Preferred Source is available and the Non-preferred Source fails while the TDEN timer is counting down, the TDEN timer will be bypassed.

Feature: Time Delay Engine Cooldown (TDEC)  
TDEC permits the generator to run under a no-load condition after a transfer from the generator source has been made. Countdown timing begins when the transfer is completed. In applications where two generators are selected, the same cool-down is used for both.

Feature: Time Delay Normal Disconnect (TDND) &  
Time Delay Normal Reconnect (TDNR)  
Timer to disconnect from an unavailable source after a user defined period of time (TDND) with a range of 0-60 seconds. It is then held off from reconnecting to the same source for a user defined period of time (TDNR) with a range of 0-60 seconds. A flowchart example is shown in Appendix C.

Feature: Time Delay Emergency Disconnect (TDED) &  
Time Delay Emergency Reconnect (TDER)  
Timer to disconnect from an unavailable source after a user defined period of time (TDED) with a range of 0-10 seconds. It is then held off from reconnecting to the same source for a user defined period of time (TDER) with a range of 0-60 seconds. A flowchart example is shown in Appendix C.

Feature: System Nominal Frequency (NOMF)  
There are only two choices for system nominal frequency of the distribution system, 50 or 60 Hertz. The dropout/pickup, underfrequency and overfrequency upper and lower setting limits are based on the nominal frequency value.

Feature: System Nominal Voltage (NOMIV)  
This refers to the standard system nominal RMS line to line voltage. A wide range (110 to 600) of sensing voltage is available to be programmed. The undervoltage and overvoltage dropout/pickup setpoint limits are based on the nominal voltage setting.

Feature: Commit to Transfer During TDNE Timing (CTDNE)  
This feature provides for selection as to whether or not commitment to transfer is desired when Time Delay Normal to Emergency countdown has begun. If no commitment is chosen and the Preferred Source returns to availability, the TDES timer is counting down, the transfer is aborted and the engine generator (if applicable) is cooled down.

Feature: Engine Test Mode (TMODE)  
This feature provides selection of the type of test that can be initiated by the front panel Engine Test pushbutton. An engine test without transferring the load to it, or an engine test with a full transfer of the load to the engine, can be chosen. Load testing is fail-safe. If the generator fails during testing for any reason, the ATC-900 will signal the transfer switch to return to normal. The External option requires a programmable input set to Engine Test Mode Select and connected to a two position switch. When the switch is open no transfer occurs during the engine test, when closed a full transfer of the load occurs during engine test. If the disable test mode is chosen, the front panel pushbutton cannot be used to initiate a test.

Feature 6B: Test Engine Run  
This feature provides selection of the length of time in hours and minutes that the ATC-900 will enable the generator contacts during an Engine Test that was initiated from the front panel pushbutton or for the plant exerciser feature, if applicable. Separate run times can be set for each.

Feature 5J:  
Undervoltage Monitoring for Source 2  
This feature constantly monitors Source 2 for an undervoltage condition. When the Source 2 voltage drops to a value equal to or below the undervoltage dropout setting, the source will become unavailable. The source’s voltage will then have to rise to a value that is equal to or above the pickup setting to become available again.

Underfrequency Monitoring for Source 2  
This feature constantly monitors Source 2 for an underfrequency condition. When the Source 2 frequency drops to a value equal to or below the underfrequency dropout setting, the source will become unavailable. The source’s frequency will then have to rise to a value that is equal to or above the pickup setting to become available again. This can be disabled in the setpoint settings under menu 2 in the Setpoints Dropouts/Pickups.

⚠️ CAUTION  
CHANGING THE SYSTEM NOMINAL VOLTAGE OR FREQUENCY SET-
POINTS WILL CAUSE PICKUP AND DROPOUT SETPOINTS TO  
CHANGE AUTOMATICALLY TO NEW DEFAULT VALUES.

For more information visit: www.eaton.com
Feature 5K: Overvoltage Monitoring for Source 2
This feature constantly monitors Source 2 for an overvoltage condition. When the Source 2 voltage rises to a value equal to or above the overvoltage dropout setting, the source will become unavailable. The source’s voltage will then have to drop to a value that is equal to or below the pickup setting to become available again. This can be disabled in the setpoint settings under menu 1 in the Setpoints Dropouts/Pickups.

Overfrequency Monitoring for Source 2
This feature constantly monitors Source 2 for an overfrequency condition. When the Source 2 frequency rises to a value equal to or above the overfrequency dropout setting, the source will become unavailable. The source’s frequency will then have to drop to a value that is equal to or below the pickup setting to become available again. This can be disabled in the setpoint settings under menu 2 in the Setpoints Dropouts/Pickups.

Feature 5L: Voltage Unbalance Monitoring for Source 2
This feature constantly monitors Source 2 for a voltage unbalance condition using symmetrical components calculations. When the ratio of negative sequence to positive sequence voltage (V2/V1) exceeds the unbalance dropout setting the Unbalance/Phase Loss time delay starts counting. If the timer expires before the unbalance is resolved the source will become unavailable. The unbalance must drop to a value that is below the pickup setting to stop the timer or to become available after the timer expires. This can be disabled in the setpoint settings under menu 3 in the Setpoints Dropouts/Pickups.

Feature 5M: Voltage Phase Loss for Source 2
This feature constantly monitors Source 2 for a phase loss condition using symmetrical components voltage calculations. When the ratio of negative sequence to positive sequence voltage (V2/V1) exceeds the phase loss dropout setting the Unbalance/Phase Loss time delay starts counting. If the timer expires before the phase loss is resolved the source will become unavailable. The phase loss must drop to a value that is below the pickup setting to stop the timer or to become available after the timer expires. This can be disabled in the setpoint settings under menu 3 in the Setpoints Dropouts/Pickups.

Feature 7B: Time Delay Engine Fail
TDEF (0 to 60 seconds) is used where at least one source is an engine generator. TDEF will delay an available source from being declared unavailable in order to override momentary generator fluctuations. This time delay is only implemented when the load is connected to a generator source. TDEF is not displayed when the number of generators is zero. TDEF is used for both generators in the Dual Generator mode.

Feature 8C/8D: Transfer Time Delay Bypass
This feature allows a pushbutton input to be used to bypass the timer for standard feature (TDNE) or standard feature (TDEN) individually, or both simultaneously. This pushbutton is on the front of the controller (pushing “Enter” and “Help” at the same time. One could also wire in a pushbutton remote switch to any of the Inputs to do the same function. This feature is usually used in testing when it is not desirable to wait for completion of the timing sequence.

Feature 9B: Maintenance Mode (Monitor Mode)
This is a two position switch that is labeled Maintenance Mode for breakers, power breakers (MG) and Monitor Mode for contractors. This will place the controller in Monitor Mode and no transfers will occur and the controller will continue to monitor the availability, connected state, and voltages.

Feature 9C: Monitor
This is a two position switch that will place the controller into Monitor. It will use one of the inputs of the controller and is used for contactors. When used, no transfers will occur and the controller will continue to monitor the availability, connected state, and voltages.

Feature 10A: Preferred Source Selection
This feature permits the selection of either source (1, 2 or None, or External) as the Preferred (or Normal) Source. The Normal Source is the source that the switch always looks to for availability so that it can transfer to it. When two generators are selected and the switch has transferred to the Emergency Source, the ATC-900 will constantly be waiting and attempting to start the generator on the Preferred Source so that it may return to it. If NONE is chosen, the Preferred Source or the Normal Source will be the source that is presently attached to the load. This can be changed in the controller setpoints or one may wire up a two position switch into one of the programmable inputs (controller setpoint must be set to External).

Feature 15G & 15H
This feature, mainly for contactors, are Source Position Contacts (to Terminal Blocks) for Source 1 and Source 2. Up to 10 each position contacts for Source 1 and Source 2 may be obtained using the outputs of the controller and the I/O Modules if desired. 15G and 15H are contacts which indicate to the position even if power is removed. For Closed Transition type switches these are always available. For Open type switches, 15G and 15H are an option.

Feature 16: External Overcurrent Protection
When integral overcurrent protection is provided for either one or both sources, the need for separate upstream overcurrent protection (in most instances) is eliminated. With this factory installed feature in the ATC-900, further automatic transfer operation is locked-out until the appropriate source breaker is reset. It will continue to monitor the voltage availability and the switch positions.

Feature 16T: Load Current Unbalance Monitoring (must have option 18J DCT Module)
This feature constantly monitors the load current for an unbalance condition using symmetrical components calculations. The current unbalance enable threshold is used to avoid spurious unbalance detections under light loads. The unbalance calculations are not performed until the average load current exceeds this threshold. When the ratio of negative sequence to positive sequence current (I2/I1) exceeds the unbalance dropout setting the Unbalance/Phase Loss time delay starts counting. If the timer expires before the unbalance is resolved the connected source will become unavailable. The unbalance must drop to a value that is below the pickup setting to stop the timer or to become available after the timer expires. This can be disabled in the setpoint settings under menu 3 in the Setpoints Dropouts/Pickups.
Feature 23: Plant Exerciser
This feature provides for the automatic test operation of the generator at a pre-selected weekly interval. When the test is running, pressing and releasing the Engine Test pushbutton will cancel the test. The day of the week, hour, and minute that exercising is desired can be programmed into the ATC-900. Up to twelve separate day and month combinations can be set. The type of test, whether a load transfer or just an engine test, can also be selected (see information about External setting in Engine Test Mode). Load testing is fail-safe. If the generator fails during testing for any reason, the ATC-900 will signal the transfer switch to return to the Preferred source. The ATC-900 is factory shipped with this feature set to off.

Feature 26D: Go To Emergency
This feature enables an external contact closure to initiate a transfer from the Preferred Source to the Non-preferred Source. If the external contact is closed and the Non-preferred Source fails, the ATC-900 will transfer the load back to the Preferred Source.

Feature 26J: Undervoltage Monitoring for Source 1
This feature constantly monitors Source 1 for an undervoltage condition. When the Source 1 voltage drops to a value equal to or below the undervoltage dropout setting, the source will become unavailable. The source’s voltage will then have to rise to a value that is equal to or above the pickup setting to become available again.

Underfrequency Monitoring for Source 1
This feature constantly monitors Source 1 for an underfrequency condition. When the Source 1 frequency drops to a value equal to or below the underfrequency dropout setting, the source will become unavailable. The source’s frequency will then have to rise to a value that is equal to or above the pickup setting to become available again. This can be disabled in the setpoint settings under menu 2 in the Setpoints Dropouts/Pickups.

Feature 26K: Overvoltage Monitoring for Source 1
This feature constantly monitors Source 1 for an overvoltage condition. When the Source 1 voltage rises to a value equal to or above the overvoltage dropout setting, the source will become unavailable. The source’s voltage will then have to drop to a value that is equal to or below the pickup setting to become available again. This can be disabled in the setpoint settings under menu 1 in the Setpoints Dropouts/Pickups.

Overfrequency Monitoring for Source 1
This feature constantly monitors Source 1 for an overfrequency condition. When the Source 1 frequency rises to a value equal to or above the overfrequency dropout setting, the source will become unavailable. The source’s frequency will then have to drop to a value that is equal to or below the pickup setting to become available again. This can be disabled in the setpoint settings under menu 2 in the Setpoints Dropouts/Pickups.

Feature 26L: Voltage Unbalance Monitoring for Source 1
This feature constantly monitors Source 1 for a voltage unbalance condition using symmetrical components calculations. When the ratio of negative sequence to positive sequence voltage (\(V_2/V_1\)) exceeds the unbalance dropout setting the Unbalance/Phase Loss time delay starts counting. If the timer expires before the unbalance is resolved the source will become unavailable. The unbalance must drop to a value that is below the pickup setting to stop the timer or to become available after the timer expires. This can be disabled in the setpoint settings under menu 3 in the Setpoints Dropouts/Pickups.

Feature 26M: Voltage Phase Loss for Source 1
This feature constantly monitors Source 1 for a phase loss condition using symmetrical components voltage calculations. When the ratio of negative sequence to positive sequence voltage (\(V_2/V_1\)) exceeds the phase loss dropout setting the Unbalance/Phase Loss time delay starts counting. If the timer expires before the phase loss is resolved the source will become unavailable. The phase loss must drop to a value that is below the pickup setting to stop the timer or to become available after the timer expires. This can be disabled in the setpoint settings under menu 3 in the Setpoints Dropouts/Pickups.

Feature 29J: Manual Retransfer
This feature provides for a selection between an automatic transfer and re-transfer mode or a manual pushbutton re-transfer to Normal from the Emergency Source mode. The External option requires a programmable input set to Enable Man Retran and connected to a two position switch. When the switch is open automatic re-transfer occurs, when closed the manual pushbutton re-transfer is selected. When either the Manual or External option is selected a programmable input set to Man Retransfer and connected to a normally open pushbutton switch is required to initiate the retransfer. If this option is not selected the factory default selection is automatic.

Feature 32A: Time Delay Neutral
This feature provides a time delay in the transfer switchNeutral position when both breakers/contactors are open. This delay takes place when the load is transferred in either direction to prevent excessive in-rush currents due to out-of-phase switching of large motor loads. This feature is not available with the Neutral Load Sense Delay (TDNLD) feature.

Feature 32B: Load Voltage Decay
This feature utilizes the load voltage measurements to sense back EMF that is generated when the transfer switch is in the Neutral position. It provides a delay in transfer in either direction if an unacceptable level is sensed as established by a customer programmed level. The transfer will not take place until the back EMF decays below the acceptable programmed level. This feature has a separate setting of enabling or disabling the operation. If disabled, the transfer switch will not delay in the Neutral position and will transfer between the sources as fast as possible. This feature is not available with the Time Delay Neutral (TDN) Feature 32A.

Feature 32C: In-Phase/Load Voltage Decay
In-phase transition is a feature that will allow a transfer between two live sources only when the phase difference between the two sources is near zero. This is an open transition transfer that prevents in-rush currents from exceeding normal starting currents in the case where motor loads are being transferred.

Load Voltage Decay utilizes the load voltage measurements to sense back EMF that is generated when the transfer switch is in the Neutral position. It provides a delay in transfer in either direction if an unacceptable level is sensed as established by a customer programmed level. The transfer will not take place until the back EMF decays below the acceptable programmed level. This feature has a separate setting of enabling or disabling the operation. If disabled, the transfer switch will not delay in the Neutral position and will transfer between the sources as fast as possible. This feature is not available with the Time Delay Neutral (TDN) Feature 32A.
Feature 32D: In-Phase/Time Delay Neutral (3 Position)
In-phase transition is a feature that will allow a transfer between two live sources only when the phase difference between the two sources is near zero. This is an open transition transfer that prevents in-rush currents from exceeding normal starting currents in the case where motor loads are being transferred. Time Delay Neutral provides a time delay in the transfer switch Neutral position when both breakers/contactors are open. This delay takes place when the load is transferred in either direction to prevent excessive in-rush currents due to out-of-phase switching of large motor loads. This feature is not available with the Neutral Load Sense Delay feature.

Feature 32F: In-Phase Transition
Provides In-Phase transition, which is a feature that will permit a transfer or re-transfer between two available sources that have a phase angle difference of five degrees or less with the number of generators set to 1 or 2. The In-Phase transition feature includes permissible frequency difference and synchronization time set-points. In the event Source 1 and Source 2 fail to synchronize within the permitted frequency difference and time, the alarm relay will energize and "Failed to Sync" will be displayed on Line 1. After resetting the alarm, another in-phase transition may be attempted or a non-synchronized transfer may be initiated by failing the connected source. The adjustable frequency difference is 0.0 to 3.0 Hz. If the synchronization does not occur within a specified amount of time, the alarm relay will energize and the failure will be logged into the Transfer History as either "Sync Fail - Freq" or "Sync Fail - Phase" depending on whether the frequency difference or the phase difference was excessive.

Feature 35A: Pre-Transfer Signal
Typically associated with elevator controls, this feature provides a form C output to remotely signal an elevator that a re-transfer is about to take place. If there is a power outage, the Pre-Transfer (TPRE) is skipped. The ATC-900 has a programmed pre-transfer delay timer that can be set from 0 to 120 seconds. Timers, such as TDNE, will time out before the Pre-Transfer signal occurs.

Feature 35D: Post-Transfer Signal
This feature provides a form C output from the ATC-900 to signal that the switch did transfer. It can be set for 0 to 120 seconds. The Post Transfer output is enabled during neutral (Time DelayNeutral) but it does not start to count down TDPOST until connected to the new source.

Feature 35C: Pre/Post Transfer
This feature provides a form C output from the ATC-900 to signal that a re-transfer is about to take place. It also energizes the output to signal that the switch did transfer. The Pre/Post signal will remain enabled from the time Pre-Transfer starts until the Post-Transfer finishes, inclusive of any TDN.

Feature 36A: Emergency Inhibit (Load Shed)
This feature enables the Emergency Inhibit control input to inhibit transfers to the Non-preferred (Emergency) Source. See the Control Inputs section for more information. The ATC-900, when used in conjunction with the optional DCT metering module, has the ability to shed and pick up loads based on available generator capacity. Depending on the number of loads to be managed, an accessory I/O module may be required.

Feature 37: Go to Isolated (Neutral) Position
The Go to Isolation Position feature will allow the user to close contacts and force the switch to an open or tripped (isolated) mode. The controller’s screen will display “Go to Neutral” when it is activated.

Feature 37A: Service Equipment
This factory programmed feature makes the transfer switch suitable for a service equipment rating by responding to a Go-To-Neutral input. This will also put the controller into Monitor Mode. This feature is not available on contactor switches as Service Equipment but is available as a Go To Neutral input.

Feature 45A-L: Load Sequencing Capability
This feature provides the sequential closing of up to ten remote relays after a transfer. A customer programmed time delay is available to delay closure between each of the relays. Usually an I/O module will be used for this but the controller can be used depending on the amount of I/Os required.

Feature 46: Potential Transformer (PT) Ratio
This feature allows external voltage transformers to be used on the ATC-900’s source and load sense inputs. Once this option is enabled, the PT Ratio setpoint can be adjusted in steps of 1 between 2:1 and 500:1. Also, when this option is enabled, the Nominal System Voltage setting will be fixed at 120 or 110 volts, depending upon the Nominal System Frequency setting. If the Nominal System Frequency setting is 60 Hz then the Nominal System Voltage will be fixed at 120 volts and all voltage pick-up and drop-out setpoints will be based upon the 120 volt level. The same is true of a Nominal System Frequency of 50 Hz whose Nominal System Voltage will be fixed at 110 volts. The metering display will use the PT Ratio value to calculate and display the load and source voltages.

Feature 47x: Closed Transitions
See section 1.5.3 Closed Transition Type Operation

Feature 48F: Modbus RTU (RS-485)
This option provides integrated communications for the ATC-900 via Modbus RTU through an RS-485 port. Registers are available to read back status, voltages, frequencies, and historical data. Registers are also available for transfer switch control. Setpoints may be read back and/or programmed via a pass-through command. History and Events may also be read. Consult the ATC-900 Modbus Communications Guide (IB140006EN) for a full list of Modbus registers on the Eaton.com website. A “disabled” option has been added to the Modbus Configuration setpoint for an increased level of security in installations where Modbus communications are not desired.

ATC-900 Primary/Secondary Implementation

Feature 90A and 90B: Primary Secondary (Three Source ATS Control)
The ATC-900 Primary/Secondary controller functionality provides the user with the ability to control a three source system consisting of a utility and two generator sources. In a three source system, the Primary ATS controls the engine starting and stopping of the Secondary ATS. See Figure 19 for a block diagram of the high level connections. The Secondary ATS is kept powered up from 24VDC from the generator battery using the DCT module or a 120VAC UPS.
Failure of the generator providing power to the load is handled by reporting a Generator Fail Alarm and transferring to the second generator with normal time delays for TDES, TDEC, TDEN/TDNE, etc. The Primary controller sees this only as a failure of S2, and will react as with any other failure of S2. The Generator Fail Alarm remains active until either manually cleared or until Secondary In is removed and re-asserted to start a new session. Once a generator fails, the other generator will be kept on until either the Generator Fail Alarm is manually cleared, or Secondary In is removed. This is true even if the failed generator restarts and load is transferred back to it, e.g. if the failed generator is the preferred source.

Pre Transfer, Post Transfer, Load Sequencing, and Load Shed
The use of Pre Transfer, Post Transfer, Load Sequencing and Load Shed relays must be carefully considered in view of the dual transfer switches. It may be necessary to mirror these functions on both controllers and parallel/series relay outputs from both controllers to ensure proper control during any transfer. There will be no special handling of these signals based on Primary/Secondary setup in Phase 1 ATC-900 controllers.

Engine Test / Plant Exercise
A Primary initiated Engine Test or Plant Exercise will cause the Secondary to respond just as it does for a normal transfer. A Secondary initiated Engine Test or Plant Exercise requires Secondary In to be closed so must be carefully coordinated with the Primary test setup.

Real Time Clock
The ATC-900 has a battery backed real time clock to track date and time. The date and time can be set through the front panel System Info / Set Time & Date screen. It can also be set automatically with an optional Simple Network Time Protocol (SNTP) Client Module connected to the ATC-900’s Accessory I/O port or by writing via the Modbus port. There are several settings associated with the real time clock.

Automatic DST
Sets Automatic Daylight Saving Time (DST) on or off. This follows the current (2017) North American standard for DST. When this setpoint is set to ON, time automatically moves ahead by one hour the second Sunday in March @ 2 a.m.; time automatically moves back by one hour on the first Sunday in November @ 2 a.m.

Time Sync
Selects the time sync source or turns time sync off.
Two NTP Client module options are currently available: one PLC based and the other Meter based. Either of these options must be ordered and properly configured to function correctly. When selected, the ATC-900 real time clock will be automatically synced every minute via the SNTP Client Module. Accuracy between the ATC-900 event logs and the NTP Client time is within 10 milliseconds.
For complete details regarding setting time via Modbus, see ATC-900 Modbus Communications Guide IB140006EN.

Time Zone Offset
This setpoint works in conjunction with the time sync options to accurately display the current time for the location of the ATC-900 installation. Because SNTP is based on UTC time an offset must be specified for proper logging and display of local time on the ATC-900.

Figure 19. Secondary Three-source Transfer Switch Arrangement

Primary ATS Connections
- S1 - Utility
- S2 - Connected to Load side of Secondary ATS
- Gen Start - Provides the Primary Out functionality to signal the Secondary ATS to run its generators.

Secondary ATS Connections
- (Control power is 24VDC from generator battery)
- S1 - Generator
- S2 - Generator
- Secondary In - Indicates when its generator(s) should be running.

Secondary Generator Startup/Shutdown Operation
Handling of the Secondary’s Gen Start relays for the two generators will differ based on Preferred Source selection and TDES setpoints on the Secondary controller. The flowcharts at the end of this document show two different scenarios based on whether or not a Preferred Source is selected.

In normal operation the Primary is expected to handle TDEC and the Secondary will remove Gen Start contacts as soon as Secondary In is removed.

In the event of a source 1 power failure, (see Figure 19) the Primary ATS engine start relay closes signaling the Secondary ATS to start the preferred generator.

Note: The Secondary ATS requires the DCT module for a DC power input.

The Primary ATS handles all transfer time delays between the Utility to Generator transfer. If the preferred generator does not start within the programmed time delay, the Secondary ATC-900 will signal the non-preferred generator to start. If Preferred is set to "None", then both generators will start and the Secondary ATS will transfer to the first generator source available. The second generator will shut down 5 minutes after the ATC-900 senses the load is connected to an available source.

Secondary Generator Failure / Transfers
Generators attached to the Secondary controller can fail in two ways: they can fail to start, or fail while providing power to the load. Currently, the ATC-900 only reports a Generator Fault Alarm during starting if a generator fails to start within 90 seconds when in test or plant exercise modes. In these cases, the Gen Start contact is opened after the 90 second timeout. In non-test/exercise modes the Gen Start contact is kept closed until either the generator starts or the reason for attempting to start the generator is removed (for example, the Secondary In signal is removed).
Secondary Controller with Preferred Source

- Immediately turn on Preferred Source Gen Start
- Start Emergency Source TDES counting down

- Set transfer switch to Preferred Source (No TDN or TDEN if switch was previously on Emergency Source)
- Cancel Emergency Source TDES
- Set Emergency Source to Idle State

preferred Available?

Emergency TDES=0?

Yes

- Turn on Emergency Source Gen Start

Preferred Available?

Yes

- Set transfer switch to Preferred Source (No TDN or TDEN if switch was previously on Emergency Source)
- Turn off Emergency Source Gen Start
- Set Emergency Source to Idle state

Emergency Available?

Yes

Secondary-In goes Active?

Yes

Secondary-In Active?

Yes

- Follow normal procedures to transfer between Primary and Emergency sources based on source availability, etc.

Secondary-In Active?

No

- Set transfer switch to Emergency Source (No TDN or TDNE if switch was previously on Normal Source)
- No Change to Preferred Source Gen Start or state.

- Turn off Preferred and Emergency Source Gen Starts
- Set Preferred and Emergency Sources to Idle state

Wait for next Secondary-In Active?

No

During startup, if Emergency source comes up first, followed quickly by Preferred source, the load will be initially powered by the Emergency source followed by a transfer from Emergency to Preferred source with normal TDEN/TDN delays. Use manual retransfer to avoid this if desired. TDEC will be used to “cool down” Emergency generator.
Secondary Controller with No Preferred Source

- Set transfer switch to Source 1 (No TDN or TDEN if switch was previously on Source 2)
  - Turn off Source 2 Gen Start after fixed 5 minute TDEC.
  - Set Source 2 to Idle state

- Set transfer switch to Source 2 (No TDN or TDNE if switch was previously on Source 1)
  - Turn off Source 1 Gen Start after fixed 5 minute TDEC.
  - Set Source 1 to Idle state.

* Gen Start of the slower source will be kept on until it starts, then TDEC set to 5 minutes to turn it back off.

- Immediately turn on Gen Start for both Sources

- Follow normal procedures to transfer between sources based on source availability, etc.

Wait for next Secondary-In Active

</tbody>
</table>
### 3.5. Function Code 05 – Write Single Coil

**Programmable Outputs and Operation Commands**

Function code 05 executes a Write Coil Command to control the programmable output relays of the ATC-900 by sending the Coil Value (FF00 for coil ON, 0000 for coil OFF) to the appropriate register address.

**Note:** The programmable output must be mapped to “Remote I/O” (via Group 5 setpoints), otherwise the command is ignored and the ATC900 responds with an exception code (01 – ILLEGAL FUNCTION).

**Note:** S2 Permit (Input), S2 Request (Output), and TDIRF (Timer) are used on a private switch, please see switch instruction booklet for information on operation of each.
Appendix C: Operational Flowcharts

- Open Delayed Transition (Contactor, MCCB, Power)
- Open In-Phase Transition (Contactor, Power)
- Closed Transition (Contactor, Power)
- The use of TDND, TDNR, TDED, and TDER timers.

**Note:** These flowcharts refer to “breaker” or “contactor.”

ATC-900: open delayed transition sequence of operation flowchart
(source 1 configured as preferred source)

---

**Notes:**
1. Applicable for contactor type and power frame transfer switches with support for time delay in load disconnect ("neutral") position
2. Applicable for molded case type transfer switches
ATC-900: open in-phase transition sequence of operation flowchart
(source 1 configured as preferred source)

Notes:
1- applicable for contactor and power frame type transfer switches with support for time delay in load disconnect ("neutral") position

For more information visit: www.eaton.com
ATC-900: closed transition sequence of operation flowchart
(source 1 configured as preferred source)

Notes:
1- applicable for contactor and power frame type transfer switches with support for time delay in load disconnect ("neutral") position

Note: There are options for closed transition such as Closed Transition and Closed Transition to Load Decay or Time Delay Neutral. There is settable input (Closed Transition Inhibit) that if closed, will inhibit closed transition and switch to the open type. There is an output contact (Waiting for Sync) that will close when Closed or In-Phase transition is synchronizing.
TDND/ TDNR & TDED/ TDER Timers Transition Flowchart Example

- **Connected to Normal No Timers Counting Down**:
  - Normal Available
  - Normal Unavailable
  - TDND > 0

- **Connected to Normal TDND Counting Down**:  
  - Normal Available (Clear TDND)
  - Emergency Available (Set TDNE)

- **Connected to Normal TDND/ TDNE Counting Down**:  
  - Normal Available (Clear TDND)
  - Emergency Available (Set TDNE)

- **Disconnected from both TDNR Counting Down**:  
  - Normal Available (Set TDNR)
  - Emergency Available (Set TDNE)

- **Disconnected from both TDNE Counting Down**:  
  - Normal Available (Clear TDNR)
  - Emergency Available (Clear TDNE)

- **Disconnected from both TDNE/ TDNR Counting Down**:  
  - Normal Available (Clear TDNR)
  - Emergency Available (Clear TDNE)

**Disconnect from Normal**

- **Normal Unavailable, Commit to Transfer Off (Clear TDND/ TDNE)**

**Normal Unavailable, Emergency Unavailable**

- **TDND > 0**
- **TDNE > 0**

**TDNE = 0**

- **Connect to Emergency**

**Connect to Normal**

**Disconnect from Normal**

**Note:** Commit to Transfer overrides TDNR = 0 for Emergency Available and TDNE > 0

**TDND – Time Delay Normal Disconnect (0-10 sec)**
**TDNE – Time Delay Normal to Emergency (0-9999 sec)**
**TDNR – Time Delay Normal Reconnect (0-60 sec)**

For more information visit: www.eaton.com
Note: In all cases above if Normal disconnected for TDND prior to connecting to Emergency, TDNR shall be set upon Normal becoming available and must reach zero to enable transfers. In cases where TDEN and TDNR are both counting, both must reach zero to enable transfer.
