Pole-Mounted Three-Phase Capacitor Bank Installation
Operation and Maintenance Instructions
DISCLAIMER OF WARRANTIES AND LIMITATION OF LIABILITY

The information, recommendations, descriptions and safety notations in this document are based on Eaton Corporation’s (“Eaton”) experience and judgment and may not cover all contingencies. If further information is required, an Eaton sales office should be consulted. Sale of the product shown in this literature is subject to the terms and conditions outlined in appropriate Eaton selling policies or other contractual agreement between Eaton and the purchaser.

THERE ARE NO UNDERSTANDINGS, AGREEMENTS, WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING WARRANTIES OF FITNESS FOR A PARTICULAR PURPOSE OR MERCHANTABILITY, OTHER THAN THOSE SPECIFICALLY SET OUT IN ANY EXISTING CONTRACT BETWEEN THE PARTIES. ANY SUCH CONTRACT STATES THE ENTIRE OBLIGATION OF EATON. THE CONTENTS OF THIS DOCUMENT SHALL NOT BECOME PART OF OR MODIFY ANY CONTRACT BETWEEN THE PARTIES.

In no event will Eaton be responsible to the purchaser or user in contract, in tort (including negligence), strict liability or otherwise for any special, indirect, incidental or consequential damage or loss whatsoever, including but not limited to damage or loss of use of equipment, plant or power system, cost of capital, loss of power, additional expenses in the use of existing power facilities, or claims against the purchaser or user by its customers resulting from the use of the information, recommendations and descriptions contained herein. The information contained in this manual is subject to change without notice.

Safety for life

Eaton meets or exceeds all applicable industry standards relating to product safety in its Cooper Power™ series products. We actively promote safe practices in the use and maintenance of our products through our service literature, instructional training programs, and the continuous efforts of all Eaton employees involved in product design, manufacture, marketing, and service.

We strongly urge that you always follow all locally approved safety procedures and safety instructions when working around high voltage lines and equipment, and support our “Safety For Life” mission.

Safety information

The instructions in this manual are not intended as a substitute for proper training or adequate experience in the safe operation of the equipment described. Only competent technicians who are familiar with this equipment should install, operate, and service it.

A competent technician has these qualifications:

- Is thoroughly familiar with these instructions.
- Is trained in industry-accepted high and low-voltage safe operating practices and procedures.
- Is trained and authorized to energize, de-energize, clear, and ground power distribution equipment.
- Is trained in the care and use of protective equipment such as arc flash clothing, safety glasses, face shield, hard hat, rubber gloves, clampstick, hotstick, etc.

Following is important safety information. For safe installation and operation of this equipment, be sure to read and understand all cautions and warnings.

Hazard Statement Definitions

This manual may contain four types of hazard statements:

**DANGER**

Indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.

**WARNING**

Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

**CAUTION**

Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury.

Indicates a potentially hazardous situation which, if not avoided, may result in equipment damage only.

Safety instructions

Following are general caution and warning statements that apply to this equipment. Additional statements, related to specific tasks and procedures, are located throughout the manual.

**DANGER**

Hazardous voltage. Contact with hazardous voltage will cause death or severe personal injury. Follow all locally approved safety procedures when working around high and low-voltage lines and equipment.

**WARNING**

Before installing, operating, maintaining, or testing this equipment, carefully read and understand the contents of this manual. Improper operation, handling or maintenance can result in death, severe personal injury, and equipment damage.

**WARNING**

This equipment is not intended to protect human life. Follow all locally approved procedures and safety practices when installing or operating this equipment. Failure to comply can result in death, severe personal injury and equipment damage.

**WARNING**

Power distribution and transmission equipment must be properly selected for the intended application. It must be installed and serviced by competent personnel who have been trained and understand proper safety procedures. These instructions are written for such personnel and are not a substitute for adequate training and experience in safety procedures. Failure to properly select, install or maintain power distribution and transmission equipment can result in death, severe personal injury, and equipment damage.
Product information

Introduction
MN230003EN covers instructions for mounting capacitor bank assemblies on poles. (The single-phase capacitors in these assemblies are furnished in hermetically sealed cases containing pack assemblies impregnated with a dielectric fluid; refer to MN230002EN for installation, maintenance, and field-testing instructions of individual capacitors.) Where applicable, the requirements of national and/or local codes and insurance underwriters must be followed.

Read this manual first
Read and understand the contents of this manual and follow all locally approved procedures and safety practices before installing or operating this equipment.

Additional Information
These instructions cannot cover all details or variations in the equipment, procedures, or process described nor provide directions for meeting every possible contingency during installation, operation, or maintenance. For additional information, contact your representative.

Acceptance and initial inspection
Each capacitor bank assembly shipped is in good condition when it leaves the factory. Immediately upon receipt of a capacitor bank shipment:

1. Check each capacitor nameplate to make sure the rating is correct for the application.
2. Check the bank and each capacitor case and bushing for signs of rough handling and shipping damage. Check each capacitor case for fluid leaks.
   If initial inspection of a capacitor bank indicates a damaged bushing, dented or bulged capacitor case, a fluid leak, or damaged bank, immediately file a claim with the carrier and notify Eaton, 1520 Emerald Road, Greenwood, SC 29646.
3. If shorting wires are provided for transportation/storage, verify that these have been removed prior to energization.
4. Inspect bank frame mounting plate weld seams per Figure 1. If welding does not match Figure 1, please contact Eaton sales team.
5. Similarly to 4, inspect lifting lug weld quality prior to installation.
6. Tighten all bolts that may have loosened during shipment. Tighten the capacitor terminal clamp nuts to a torque of 16–19 ft.-lb.
7. Check for proper wiring of the capacitor units. Refer to Figure 2
8. Verify electrical clearances around and within pole-mounted capacitor bank.
9. If switches are provided with the capacitor bank, the switch contacts must remain closed during transportation and handling.
10. Test and operate all switches and secondary accessory equipment.
11. Ensure the capacitor bank frame is properly grounded per utility grounding practices.
12. Optionally, a thermal scan may be performed on all electrical connections to check for overheated electrical joints. The thermal scan must be performed after a minimum of two (2) hours of continuous energization. Pay particular attention to the capacitor terminal temperatures.

Handling and storage
Be careful during handling and storage of the capacitor bank assembly. If it is to be stored for any length of time prior to installation, provide a clean, dry storage area. Equipment must remain in the upright position during handling, storage, and installation.

Standards
ISO 9001 Certified Quality Management System.

Documentation
Each pole-mounted capacitor bank is shipped with a copy of the instruction manual, general arrangement drawing, and bill of materials.
Safety precaution

⚠️ DANGER

Hazardous voltage. Explosion hazard. Do not energize a capacitor unit that has been shorted terminal-to-terminal or that has bulged or otherwise damaged tank. Failure to comply will result in death or severe personal injury.

⚠️ WARNING

Hazardous voltage. Residual capacitive voltage may be present in the capacitor units after de-energizing. Follow the appropriate shorting procedure to discharge any residual voltage. Failure to comply can cause serious injury or death.

Before any work is performed on the capacitor bank the following procedure should be completed as a minimum requirement:

1. If switches are provided, electrically or manually open all of the switches.
2. Open the fuse cutouts.
3. DO NOT ground the capacitor bank immediately after the bank has been disconnected from the system. For capacitor banks with capacitor units containing discharge resistors designed to discharge the capacitor unit from peak rated voltage to less than 50 V in five minutes, allow five minutes before grounding. For capacitor banks with units containing discharge resistors designed to discharge the capacitor unit from peak rated voltage to less than 75 V in 10 minutes, allow 10 minutes before grounding. In the absence of design information, wait 10 minutes before grounding.
4. Ground all parts after de-energization and before touching frames or terminals. Ground the neutral of ungrounded capacitor banks.
5. For a fixed pole-mounted capacitor bank, ground the jumper leads on the source side of the capacitor unit between the fuses cutout and capacitor unit terminal. For a switched capacitor bank, ground the jumper leads on the source side of the capacitor unit between the capacitor switch and the capacitor unit terminal.
6. Before handling, short circuit the terminals of all capacitor units.
7. Do not re-energize a capacitor that has possibly failed. Indications of failure include bulged or damaged tank, capacitance that is out of specified tolerance, operated fuse cutout, or indications of external arcing.
8. Use all precautions for capacitor equipment in the same manner as listed under the utilities regulations for high tension equipment.

Installation procedure

⚠️ CAUTION

Lift a capacitor rack by the lifting eyes on the rack frame. Do not lift the rack assembly by the capacitor unit hangers.

For switched capacitor banks, open all switches prior to installing the capacitor bank on the pole.

Mounting instructions

User-furnished hardware:

Capacitor bank mounting
- Two 3/4-in. bolts. (Required length is determined by pole diameter.)
- Two 3/4-in. lockwashers.
- Four 3/4-in. washers.
- Two 3/4-in. nuts.

Pole brace mounting
- Two 1/2-in. lagscrews or thru bolts.

Control wiring
- Compression-type entrance bushing.
- Control and low-voltage supply cable.

Procedure

1. On an 18-in. center on the pole, drill two holes for the 3/4-in. bolts.
2. Insert the two 3/4-in. bolts through the holes, using washers and lockwashers as needed. Thread the nuts onto the bolts but do not tighten.
3. Using the lifting eyes on the capacitor bank frame, lift the capacitor bank, positioning it at the pole so that the bolts can slip into the slots on the capacitor bank pole-mounting bracket. (Figure 3)
4. Lower the capacitor bank onto the bolts.
5. Tighten the nuts on the bolts securely.
After the capacitor bank has been securely mounted on the pole, install the pole braces (not supplied for 3 unit frames):

1. Using the furnished hardware, attach one end of a brace to the slot located under the capacitor mounting angle on the capacitor bank frame as shown in Figure 4, but do not tighten the nut on the bolt.
2. Place the other end of the brace against the pole at an angle of approximately 45° and fasten with a 1/2-in. lagscrew or thru bolt.
3. For a snug fit, force the end of the brace attached to the capacitor bank toward the pole and tighten the nut and bolt in the capacitor bank frame.
4. Repeat steps 1, 2, and 3 for the other brace.

Control wiring instructions
Switches are factory-wired to the junction box on pole-mounted banks. If the control cable and/or potential transformer is not supplied by Eaton, then the control cable and the potential transformers, or low voltage supply, must be user-supplied. To connect the user-supplied control cable and low-voltage supply cable to the terminals in the junction box:

1. Insert the control cable through the bottom junction box hole using a compression-type entrance bushing.
2. Insert the low-voltage supply cable into the junction box using a compression-type entrance bushing.
3. Wire the control cable and the low-voltage supply cable as shown on inside of the junction box cover.

Electrical connections
The conductor used to connect the capacitor bank to the system should have a continuous current rating of at least 35 percent more than the nominal phase current rating of the bank.

The assembly of all electrical connections is of vital importance to the proper operation of the capacitor bank. All electrical connections should be made in accordance with the instruction manual.

Grounding
A clamp type terminal is provided on each capacitor bank frame located on the frame mounting bracket. The terminal can accept a #12 AWG to a #1 AWG solid copper conductor. It is recommended that the capacitor bank frames be solidly grounded.

Fusing
The capacitor bank must be protected by properly sized fuses that will enable the bank to be rapidly disconnected from the system before damage occurs to the bank in the event of a fault. The fuse link should be sized accordingly to allow fast operation of the fuse and be able to withstand inrush currents from switching and line transients and outrush current through external faults without melting the fuse link. Eaton can recommend proper fusing if requested.

Surge arresters
It is recommended that pole-mounted capacitor banks be protected against overvoltages due to lightning or switching surges with surge arresters. To protect the capacitor bank from the high overvoltages associated with a switch restrike, the arresters should be applied as close to the capacitor bank as possible.
Pole-Mounted Three-Phase Capacitor Bank Installation

Operation

Service conditions and operation
Refer to the applicable codes and standards such as IEEE Std 18™ standard, IEEE Std 1036™ standard, and or IEC 60871-1.

Inrush and fault current
For a switched capacitor bank when the switch is closed, a high frequency, high-magnitude current flows into the bank attempting to equalize the system and capacitor voltages. If the bank is isolated from other banks, the inrush current is limited by the inductance of the source and the capacitance of the bank. If two or more capacitor banks are connected on the same bus, very high magnitude and frequency currents are possible.

Current outrush from a capacitor bank may also be a concern if a fault develops in the vicinity of the capacitor bank or a breaker closes into a nearby fault. Eaton's capacitors will satisfactorily withstand these high magnitude and high frequency currents. However, other equipment such as capacitor bank switching device, fuses, and other devices may not withstand these currents. It is recommended that the factory be consulted when the banks will be switched back-to-back or anytime there is doubt regarding the magnitude and frequency of the currents, or the suitability of the installation.

Switching
Upon de-energization of the bank, wait ten (10) minutes prior to re-energization. Successive rapid switching can result in the failure of the capacitor units. Capacitor controllers generally have adjustable close inhibit settings.

Switches
The switches should be inspected and tested periodically depending on the operating conditions and the number of switch operations. Refer to the switch service manuals for specific inspection and testing instructions.

Field testing
Occasionally, it is necessary to field test capacitors to determine if any damage or failure has occurred. This is particularly important if the capacitors have been subjected to unusual service conditions or if a fuse has operated.

Checking the capacitance of a unit with a low voltage capacitance meter is the best way to determine whether or not the capacitor is partially failed.

Equipment description

Capacitor units
Single phase capacitor units are used in the pole-mounted capacitor banks. The single phase capacitor can be configured with either a single or double bushing configuration. The capacitors contain a non-PCB dielectric fluid hermetically sealed within a stainless steel tank. Eaton’s capacitor units contain internal discharge resistors which reduces any residual voltage present on the capacitor unit after removal from service.

Refer to document MN230002EN for the capacitor unit installation and maintenance instructions.

Mounting frame
The pole-mounted capacitor bank frames are made from aluminum. Steel frames are available upon request. The capacitor bank frames are available in 3, 6, 9, and 12 unit configurations. The frames are designed to support the capacitor units and other optional components. The frames are also designed to maintain the proper electrical clearances of the components mounted on the frame.
Vacuum switches
Vacuum switches are available as an option to provide switching for the pole-mounted capacitor bank. The switches are available with a motor or solenoid operator which can be operated remotely or locally.

Refer to the vacuum switch installation and operation instructions for additional information. If not provided with the capacitor bank, contact your local Eaton's Cooper Power series product representative or Eaton’s Cooper Power series product service center.

Oil-filled switches
Eaton’s Cooper Power series oil-filled switches are available as an option to provide switching for the pole-mounted capacitor bank. The switches are available with a motor operator and can be operated remotely or locally.

Refer to the oil-filled switch installation and operation instructions for additional information. If not provided with the capacitor bank, contact your local Cooper Power series product representative or Eaton’s Cooper Power series product service center.

Control power transformers
Potential transformers are available as an option to provide control power to the switches and other components included with the pole-mounted capacitor bank.

Refer to the transformer installation and operation instructions for additional information. If not provided with the capacitor bank, contact your local Cooper Power series product representative or Cooper Power series product service center.
Surge arresters
Surge arresters are available as an option to protect against over voltages and transients. Refer to document MN235006EN/Old S235-35-1 for the surge arrester installation instructions.

Figure 9. Surge arrester

Current-limiting reactors
Reactors are available as an option to protect the capacitors and capacitor switches from excessive inrush currents. Refer to document CCM52B for mounting instructions.

Figure 10. Current-limiting reactor

Fuse cutouts
Fuse cutouts are available as an option to protect the capacitors. Fuse cutouts will allow the capacitors to be rapidly disconnected from the system before any damage occurs in the event of a fault. Refer to document MN132007EN for the fuse cutout installation instructions.

Figure 11. Fuse cutout

Sensors
Voltage and current sensors are available as an option to monitor the line voltage or current and neutral voltage and current. Refer to the sensor installation and operation instructions for additional information. If not provided with the capacitor bank, contact your local Eaton’s Cooper Power series product representative or Eaton’s Cooper Power series product service center.

Capacitor controllers
Capacitor controllers are available as an option to provide local or remote operation of the switches. Capacitor controllers are available with various control options such as VAR, voltage, power factor, temperature, and time. Refer to the controller installation and operation instructions for additional information. If not provided with the capacitor bank, contact your local Cooper Power series product representative or Eaton’s Cooper Power series product service center.
