

# The top 6 things to do to help prevent a cyber attack.

## 1 Always have unique, random passwords

Do NOT use the factory default passwords.

## 2 Stay up to date with software versions

Do NOT wait to apply system patches.

## 3 Review your logs often for alerts or questionable activity

Do NOT wait months to do this task.

## 6 Consistently monitor your network traffic

Do NOT overlook the smallest questionable activity.

## 5 Implement strict security for remote access

Do NOT allow unsecure and unknown remote access.

## 4 Secure unused ports

Do NOT leave unnecessary ports enabled.
